Over time, the optimistic consensus among doctors and lawyers that the sexual offenders singled out by the law would benefit from treatment began to erode. Attorneys were the first to turn against these laws, consistent with legal concerns about liberty and autonomy. Eventually, however, mental health practitioners began to realize as well that treatments for this population were not as effective as had been hoped, and withdrew their support for the sexual psychopath laws. The Group for Advancement of Psychiatry (GAP) concluded in its 1977 report that the statutes were "social experiments that have failed and that lack redeeming social value" (GAP 1977). Complementary social trends that undermined support for the laws included the civil rights movement in the 1960s, the rise of the women's movement somewhat later (to the extent it promoted a desire to deal punitively rather than therapeutically with perpetrators of violence against women), and toward the 1980s, the general societal turn to more punitive "law and order" rather than rehabilitative policies. In the 6-year period between 1975 and 1981, more than half of the sexual psychopath statutes were repealed. By the mid-1980s, only 13 states still had these laws, and only five states applied them with any frequency (Massachusetts, Nebraska, New Jersey, Oregon, and Washington). The leading U.S. Supreme Court case of this era is *Specht v. Patterson* (1967), in which the court mandated the application of most criminal procedural safeguards to sexual psychopath commitments. These included a full judicial hearing, assistance of counsel, the right to confront and cross-examine adverse witnesses, the right to present one's own witnesses and evidence, and a final decision sufficiently articulated to permit meaningful review on appeal. In a subsequent case (*Allen v. Illinois* 1986), the U.S. Supreme Court held that the Fifth Amendment's self-incrimination privilege did not necessarily extend to the psychiatric examination in sexual psychopath commitments. By this point, however, such commitments were procedurally encumbered in every other way and quite rare. U.S. jurisprudence regarding sex offenders was close to where it was before the whole sexual psychopath law experiment began, with criminal incarceration of sex offenders undifferentiated from any other offenders.

SEXUALLY VIOLENT PREDATOR LAWS

In 1989, Earl Kenneth Shriner was released from a 10-year prison sentence in Washington State for kidnapping and

sexually assaulting two teenage girls. He had been found not to be committable under the state's civil commitment statute, and on the day of his release from prison proceeded to rape a 7-year-old boy, cut off his penis, and leave him to die. This case caused widespread outrage, and in 1990 Washington passed the first of a new generation of sex offender laws known as Sexually Violent Predator Acts. Soon other states passed laws modeled on the Washington statute, and by the end of the millennium 16 states had enacted laws of this kind, including Arizona, California, Florida, Illinois, Iowa, Kansas, Massachusetts, Minnesota, Missouri, New Jersey, North Dakota, South Carolina, Texas, Virginia, Washington, and Wisconsin. Today the number stands at 20, including Pennsylvania (2003), Nebraska (2006), New Hampshire (2007), and New York (2007). The two atypical states include Texas, where SVP commitments are limited to outpatient treatment, and Pennsylvania, which allows only for the civil commitment of offenders who perpetrated their sexual offenses as juveniles and are "aging out" of the juvenile justice system at age 21. In addition, as mentioned, a federal SVP commitment law was passed in 2006 (the Adam Walsh Child Protection and Safety Act) and was sustained by the U.S. Supreme Court 4 years later in the *Comstock* case (*U.S. v. Comstock* 2010). Although the challenge to the law in this case initially duplicated many of the arguments settled in the 1997 *Hendricks* case (see below), the only surviving question by the time the case came before the U.S. Supreme Court was whether the enactment of a federal commitment law was a constitutional exercise of Congress' power under the Necessary and Proper Clause. The court ruled that it was. The Necessary and Proper Clause is a famous open-ended phrase in the Constitution that forms the basis for innumerable laws passed, for good or ill, by the federal legislature to implement its limited enumerated powers.

The central elements of the SVP laws are (1) legal authority for continuing to detain sex offenders with diagnosed mental disorders who are already in custody and likely to re-offend if released; and (2) implementation of the goal of continued confinement via civil commitment to a treatment facility The vast majority of this designated population are offenders convicted of any of a series of enumerated serious sexual crimes, but the laws also apply to those found Incompetent to Stand Trial or Not Guilty by Reason of Insanity (NGRI) for such crimes. Except for Texas, the laws and practices of the states aim to confine those found eligible under the SVP statutes to secure inpatient institutions. Even so, the laws provide for conditional release either as an alternative to initial placement in a secure facility, or more commonly, as a final phase of supervision and rehabilitation following inpatient treatment.

The laws uniformly require proof of four general conditions for civil commitment: (1) one or more charges (if found NGRI or Incompetent to Stand Trial) or convictions for sexually violent offenses; (2) a qualifying "mental abnormality"; (3) a specified likelihood of engaging in further acts of predatory sexual violence; and (4) a causal link between the mental abnormality and the risk of sexual recidivism. "Sexually violent offenses" are described by the SVP statutes as those found in the criminal code that involve forcible contact such as rape or, in its absence, physical contact with an underage victim. "Mental abnormality" is defined in the original Washington statute (and that of most other states with only minor differences in wording) as "a congenital or acquired condition affecting the emotional or volitional capacity which predisposes the person to commit criminal sexual acts in a degree constituting such person a menace to the health and safety of others" (Wash. Rev. Code. Ann. 1992).

As evident from the description above, SVP laws are explicitly focused on sexually violent behavior, which may be caused by any type of broadly defined mental condition or disorder. As a result, these laws have been interpreted to permit nonsexual and personality disorders as the qualifying mental abnormality, including Antisocial Personality Disorder (APD). Nonetheless, the vast majority of commitments have been for paraphilic disorders, usually with comorbid conditions. Pedophilic Disorder and "Paraphilia Not Otherwise Specified—Nonconsensual" (i.e., paraphilic rape, which is termed "Other Specified Paraphilic Disorder" in *DSM-5*) are the most common paraphilic disorders diagnosed in the SVP commitment population, although other paraphilic disorders are often present as well. Diagnoses of Pedohebephilic Disorder and Paraphilic Coercive Disorder were proposed for *DSM-5*, but rejected in large part out of concerns that they might facilitate SVP commitments (Tucker and Brakel 2012). These disorders of sexual deviance usually occur in conjunction with a variety of disinhibiting conditions including APD, other personality disorders, substance use disorders, intellectual disabilities or borderline intellectual functioning, other neurodevelopmental disorders (e.g., Autism Spectrum Disorder and Attention Deficit/Hyperactivity Disorder), psychotic disorders, mood disorders, minor and major neurocognitive disorders, and traumatic brain injuries. As might be expected, research has indicated that these associated disinhibiting conditions may increase the risk for sexual recidivism in paraphilic offenders (e.g., Alden et al. 2007; Hildebrand et al. 2004; Phenix and Sreenivasan 2009).

An array of biological and psychosocial treatments have been developed over the last few decades for paraphilic disorders and many of the most frequently co-occurring conditions (see Chapter 81). These treatments are roughly equivalent in their efficacy to the treatments that are commonly employed for other chronic mental illnesses, although they are only rarely utilized by psychiatrists. The goal is to achieve a level of workable symptomatic (emotional and behavioral) control rather than "cure," similar to the treatment objectives for most other chronic medical and psychiatric disorders.

The assessment of risk for sexually violent recidivism generally involves obtaining a baseline statistical risk estimate by using one or more of a number of actuarial instruments that have been developed for this purpose (e.g., Static-99R, Static-2002R, MnSOST-R, SORAG, etc.—see Chapter 70). Clinical judgment is then applied to this baseline estimate,

with adjustment of the risk level made by considering the limitations of the actuarial instruments. For example, most sex offenses are not detected or reported, nor end in the perpetrator's arrest or conviction, and sexual recidivism risk persists beyond the finite time limits specified by the instruments (CSOM 2001; Hanson and Morton-Bourgon 2004). Additional research-proven risk-enhancing and risk-reducing factors not included in the instruments are also considered, as well as specific factors relevant only for the individual evaluee (e.g., debilitating physical illnesses of various kinds). This application of statistically validated risk factors in an individualized, clinically appropriate manner has been termed the clinically adjusted actuarial approach to risk estimation (Hanson 1998) (see Chapter 69). There are varying political and scientifically grounded ideas about what should constitute acceptable false-positive rates (commitment of nonrecidivists) and false-negative rates (release of recidivists). Likewise, there is variability among SVP laws in the statistical threshold for legal commitment, with most SVP laws requiring a "likelihood" or "substantial likelihood" of sexually violent recidivism for commitment, and little agreement on what these differential terms mean in application.

The process of commitment in most states involves a series of steps, and provides a variety of procedural safeguards. First, correctional staff screen those sexual offenders who are approaching their release, in order to select those who have committed statutorily designated sexually violent crimes. These individuals are then referred for comprehensive evaluation by clinicians who ideally have appropriate training and experience in sex offender evaluations. Those who are found to meet all of the statutory criteria (appropriate offense history, qualifying mental abnormality, and likelihood of sexually violent recidivism due to mental abnormality) are then referred to the prosecuting attorney's office, where further filtering occurs. This order is reversed in some states where, usually after an initial correctional screening, SVP candidates are reviewed by a prosecutor for legal viability before being referred to the state's mental health evaluators. A probable cause hearing is then held to determine whether sufficient evidence exists to proceed to the full trial, followed by the trial itself. The minimum standard of proof for mental health commitments was established in 1979 by the U.S. Supreme Court (*Addington v. Texas* 1979) as "clear and convincing evidence," although a majority of states have adopted the more stringent standard of "beyond a reasonable doubt" for SVP cases, i.e., the level of proof required for criminal conviction. Constitutionally, there is no right against self-incrimination in SVP proceedings (as per *Allen v. Illinois*), and the laws of some states provide for the possibility of penalizing an SVP commitment candidate for noncooperation with the state's evaluator by barring evidence offered by the candidate's own expert(s). However, in most states it appears that no penalty is exacted for refusing to cooperate. Commitments are generally for renewable periods of a year or two, or for an indefinite period, with the burden on the state to periodically justify continued commitment. Release is mandated when the offender has improved to the point where he or she can safely be managed in the community with appropriate treatment and supervision, and no longer meets the SVP criteria as determined by the court. Some states require a person committed under the SVP law to furnish a DNA sample, similar to criminally convicted felony sex offenders—an identification tactic increasingly used by law enforcement officials for many other kinds of convicted felony offenders as well.

Figure 80.1 illustrates the path of the commitment process in California, one of the biggest users of SVP civil commitment, as of December 31, 2013. There are more than 90,000 registered sexual offenders living in California communities and institutions, and more than 20,000 sexual offender inmates in the California Department of Corrections and Rehabilitation (CDCR) (CASOMB Report 2008). Each year, approximately 8000 sexual offenders are convicted of a felony sex offense, and roughly 39% of those convicted are sent to prison. Since the enactment of California's SVP statute in 1996, the CDCR has screened an average of about 250 convicted sex offenders per month who are eligible for release. This amounts to 53,927 inmates screened over the 18 years from 1996 to 2013, of which 14,335 (about 27%, or one-quarter of the total) were referred to the Department of Mental Health for further evaluation. Only 1983 individuals (3.7%) were evaluated as meeting the commitment criteria by state psychologists, and cases were filed by the District Attorney in 1736 instances (3.2%). Probable cause was found in 1431 cases (2.7%), and there have been 806 commitments after trial (1.5%), with 386 cases pending. As can be seen, only a small subset of all sex offenders have actually been committed under this law, i.e., about 1.5% of all released sex offenders.

In the United States as of 2014, a total of 4658 individuals were residing in inpatient facilities as civilly committed, and 829 individuals were in detention prior to commitment hearings, among the 17 programs who responded to a Sex Offender Civil Commitment Programs Network (SOCCPN) annual survey. Only 6 of 17 states (California, Illinois, Minnesota, New Jersey, Virginia, Washington) reported having civilly committed female clients, and these had very few (SOCCPN 2014). Five of the 20 states with SVP laws were holding civilly committed sex offenders separately in special facilities designated for such offenders, as opposed to mixing them with pre-commitment detainees (D'Orazio et al. 2009). In the 2014 SOCCPN survey, the states with the highest number of detained and/or committed SVP inpatients were California (929), Minnesota (701), Florida (633), Illinois (538), and New Jersey (484), while the lowest numbers were from New Hampshire (10), Pennsylvania (40), North Dakota (56), Federal BOP (62), and Arizona (94).

Despite early predictions that committed SVPs would never be released given the laws' announced intent to target only the worst of the worst (the typical statutory language speaks of "a small but extremely dangerous group of sexually violent predators…unamenable to existing treatment modalities"), this has not proven to be the case. Currently, among 17 responding programs in the SOCCPN survey,

California Dept. of State Hospitals - Sex Offender Commitment Program Summary Statistics Report

Summary Statistics Report 1/1/1996 Through 12/31/2013

1. Total Cases Referred	2. Total Offenders:	3. Deceased While in Custody:
53,927	26,008	178

4. Administrative Record Review and Clinical Screen Summary:				
(a) Suspended	(b) Stopped	(c) Returned	(d) Evaluate	(e) Pending
152	249	39,185	14,335	6

5. Referral Outcome Summary:					
(a) Positive	(b) Negative	(c) Pending	(d) Returned	(e) Suspended /Stopped	(f) Turner Decision

Figure 80.1 California Department of State Hospital: Sex offender commitment program summary statistics report.

769 individuals have been conditionally released, 1592 have been unconditionally released, and there are currently 344 conditionally released SVP outpatients (SOCCPN 2014). These same programs reported that 168 individuals had been returned to a facility following full discharge or conditional release for a variety of new violations and/or crimes. SVP treatment costs are an important concern. Average annual SVP treatment program costs in 2006 (the most recent data available) were $94,000 per person, ranging from a high of $166,000 in California to a low of $17,391 in Texas (where treatment is delivered in the community rather than an inpatient institution). Outpatient costs are not always lower than inpatient costs, however, and in some states with high-intensity conditional release monitoring and treatment programs may be substantially higher, well exceeding $100,000 per capita. This is generally equivalent to the cost of treating mentally disordered offenders in state hospitals, but represents more than three times the cost of incarcerating these individuals in prisons (Gookin 2007). Consideration of these costs of incarceration and treatment for sex offenders, however, should be weighed against the incalculable societal costs and harms associated with rape and child sexual abuse crimes (Heil and English 2007).

The first constitutional test to the U.S. Supreme Court of the new SVP laws occurred in 1997 in the case of *Kansas v. Hendricks* (1997). Leroy Hendricks had been molesting children for many years, including his own stepdaughter and stepson, and he himself admitted that he would stop only when he died. His attorneys appealed his commitment under Kansas' SVP law on the grounds of (1) substantive due process, (2) double jeopardy, and (3) the *ex post facto* doctrine. The substantive due process argument was that the commitment criterion of "mental abnormality" failed to satisfy the requirement that an individual be mentally ill and dangerous before he or she can be committed to a mental facility. There is a long history of legal doctrine

(and philosophical tradition) in American jurisprudence that the state cannot confine someone for dangerousness alone (i.e., for *potential* misconduct) without some accompanying mental condition or impairment, as this would constitute an impermissible form of preventive detention (e.g., see *Foucha v. Louisiana* 1992). Justice Thomas, writing for a narrow 5–4 majority, rejected Hendricks' contention that "mental abnormality" failed to qualify, noting that the definition of medical terms for legal purposes is a legislative task, and that the diagnosis of pedophilia is classified by the psychiatric profession itself in *DSM-IV* as a serious mental disorder (Tucker and Brakel 2012). In particular, the majority opinion stated that the "mental abnormality" involves an inability to control sexually violent impulses. It also noted that the claims of double jeopardy (one can be tried only once for violation of the law) and *ex post facto* (one cannot be held to account under laws made after the fact) apply to the criminal law only. Relying on the prior *Allen v. Illinois* decision, the majority found that despite various criminal law-style safeguards, the SVP law described a legitimate civil procedure. In addition, the opinion noted that the law would be valid even if treatment were not medically available (based on the long history in this country of permitting detention and segregation of dangerous individuals with untreatable contagious diseases or mental disabilities), as well as if treatment were available but only secondary to the primary goal of continued confinement (so long as some form of treatment is prescribed).

SVP TREATMENT

Until the 1980s–1990s there was no standard treatment for sex offenders, and a variety of unvalidated psychotherapeutic, behavioral, and pharmacological approaches were used. However, a number of treatments have recently been developed and shown to be effective in reducing sexual recidivism (Hanson et al. 2002; Ward et al. 2008; Thibaut et al. 2010) (see Chapter 81). As a result, there has been significant upgrading of treatment provided for all sex offenders, including committed SVPs. Nearly all states have clearly defined stages and/or phases of their programs, with specific groups at each phase that the resident must meaningfully participate in or complete. The vast majority of programs require patients to participate in cognitive-behavioral group psychotherapy that emphasizes the identification of relapse prevention and risk management plans, with a focus on management of dynamic (changeable) risk factors, behavioral management of sexual arousal (e.g., masturbatory satiation), and intervention in the sexual reoffense cycle. These programs generally offer content for special-needs groups such as psychiatrically impaired or developmentally disabled offenders, and most also use individual psychotherapy as well as polygraph and penile plethysmography (PPG) assessment. These practices reflect a standard of treatment service structure and content that is generally consistent with recommendations made by Marques (2001) and by the Association for the Treatment of Sexual Abusers (2001). Currently, although 8 out of 15 responding programs say they contemplate [or permit] antiandrogen treatment on a voluntary basis, such treatment is in fact only rarely prescribed (0.43%–6% of resident population) (SOCCPN 2014).

The importance of a conditional release phase has been demonstrated by research indicating that poor community reintegration planning for child molesters released from prison is a risk factor for sexual recidivism (Willis and Grace 2008). This final phase in which qualified residents are conditionally released to the community has been called central to the credibility and effectiveness of these programs (Marques 2001). Nonetheless, only 10 of 16 responding states with inpatient SVP programs currently report having some form of conditional release arrangement (SOCCPN 2014). These programs provide assistance with community living arrangements, obtaining outpatient treatment services, case management, monitoring, and crisis intervention services.

FUTURE DIRECTIONS

SVP laws are the latest effort in the United States to devise a combined incapacitation-focused (via confinement) and therapeutic approach for the most dangerous, repeat sexual offenders. These laws may ultimately have the beneficial effect of forcing psychiatry to face sex offenders as treatable patients, and in so doing to expand training, to fund and conduct research, and to refine methods of assessments and treatment for this challenging population. The following is a list of suggestions for improvement in SVP legal and clinical policy, adapted from D'Orazio et al. (2009):

1. Start sex offender treatment in the correctional setting, as this could reduce the need for SVP commitments, enhance treatment gains, mitigate risk of reoffense, and save money while enhancing community safety.
2. Do not house probable-cause (pre-commitment) SVP individuals together with committed SVPs in the regular inpatient program, particularly if they decline to enroll in treatment, as they generally have a disruptive effect on the treatment milieu.
3. Enhance public education with information about SVP individuals, their treatment, and supervision in order to decrease misperceptions and increase the likelihood of safe reintegration.
4. Provide state-sponsored transitional housing for conditionally released SVPs to help reduce the widespread public fear and confusion regarding where these individuals are to be placed in the community.
5. Establish and fund research on treatment processes and outcomes for SVPs, including post-release recidivism data, so that future policy can be more data driven than crisis driven.
6. Improve collaboration among state agencies providing SVP treatment, particularly regarding the development of specific standards of treatment for this population. For example, the Sex Offender Civil Commitment Programs Network (SOCCPN) has

existed officially since 2006, with the stated mission of providing a forum to share information related to the effective management, assessment, and treatment of individuals held under civil commitment laws (SOCCPN 2014).

7. Redefine sexual offending as a public health problem that requires comprehensive cross-agency collaboration, involving both the correctional and mental health systems. A greater proportion of resources could then be expended toward primary prevention, i.e., preventing sex offenses in the first place by facilitating early intervention with at-risk individuals and families, and making community treatment available for paraphilic individuals.
8. Conduct a cost–benefit financial analysis with recommendations for best practice, including primary prevention and potentially less costly forms of sexual offense containment than SVP commitment.
9. Revise state laws that mandate reporting of individuals who in the course of treatment describe a history of sexual offending, as this unduly interferes with the treatment process and prevents individuals from coming forward to participate in it.
10. Develop risk assessment instruments that are specific to discrete paraphilic and sex offender populations, as recidivism base rates and the accuracy of the actuarial instruments vary across clinical samples and legal jurisdictions.
11. Change the designation for this group of dangerous sex offenders from "sexually violent predators" to something less stigmatizing, because this label yields extremely negative responses and gravely diminishes the released offenders' opportunities for housing, employment, interpersonal relations, and successful reintegration into the community.

SUMMARY KEY POINTS

- SVP laws have existed in the United States since 1990, and provide for the civil commitment of a small proportion (about 1%–2%, typically those convicted of dangerous contact offenses) of sexual offenders at the end of their criminal sentences.
- The U.S. federal government and 20 states currently have SVP statutes, and while there is no centralized database, recent surveys indicate a national census of approximately 5000 currently committed. Over the course of the programs' respective lives, surveys count 769 individuals who have been conditionally released, and at least 1592 who have been unconditionally released.
- SVP treatment programs strive to conform to a best-practices model of sex offender treatment, consisting of a cognitive–behavioral orientation with a focus on relapse prevention, phased progression, modification of dynamic risk factors for reoffense, and programming for special-needs groups, though only about half have a conditional release phase, and only about 1%–5% of committed individuals receive (voluntary) antiandrogen treatment.
- Statutory registration and notification requirements exist in all 50 states and are independent of SVP status, while employment and residency restrictions exist in some 20 states (not counting additional states with local municipal and county ordinances to this effect).

Clinical assessment and treatment of sex offenders

JOHN BRADFORD, A.G. AHMED, AND SANJIV GULATI

INTRODUCTION

Although sexual behavior, partly expression of a basic biological drive (sex drive), is normal in most humans, it becomes problematic and criminal in nature in certain individuals. When this occurs, some of the most heinous crimes take place, and clinicians are often called on to provide opinions on the probable reason for and treatment of such aberrant behavior. Generally sex offenders are a complex and heterogeneous group of mostly male offenders, with varying types and severity of personality disorders and mental disorders including paraphilias and paraphilic disorders (American Psychiatric Association [APA] 2013) or more commonly multiple paraphilias (Bradford et al. 1992). A number of sex offenders do not have any paraphilia or paraphilic disorder or psychiatric diagnosis, but are convicted of sex crimes where they have failed to control their impulses or simply committed a crime categorized as a sexual offense by their culture or legal jurisdiction. This chapter examines the key aspects of clinical assessment and treatment available to both adult and adolescent sex offenders.

Sex offenders are individuals who commit sexual offenses and largely suffer from a sexual deviation or paraphilia. There are a number of sex offenders who do not have a paraphilia/paraphilic disorder but fail to control their sexual impulses for other reasons. Their sexual offending behavior may be opportunistic or impulsive, and most commonly is the result of serious personality disorders. Sexually deviant behavior can also occur secondary to various Axis 1 psychiatric conditions. The deviant sexual behavior in this instance would occur as a result of disinhibited behavior caused by the primary psychiatric condition (e.g., bipolar disorder). In these cases, the treatment of the sexual deviant behavior is through the treatment of the primary psychiatric disorder. Where the primary psychiatric problem is a serious personality disorder, the prognosis would be poor because of the inherent problems in the treatment of serious personality disorders. At the same time, there is a possibility that the symptoms of serious personality disorders such as impulsivity may respond to psychopharmacological treatment (Lee and Coccaro 2001). As there are these diagnostic issues to be resolved prior to a diagnosis of a paraphilia being made, a careful psychiatric evaluation needs to be completed.

For the first time in *Diagnostic and Statistical Manual of Mental Disorders*, 3rd edition (*DSM III*) the concept of erotic or sexual preference was recognized, and the sexual deviations were classified as paraphilias as opposed to personality disorders. This accepted the empirical evidence that individuals who were sexually deviant had an abnormal sexual or erotic preference.

The essential features of *Diagnostic and Statistical Manual of Mental Disorders*, 4th edition (*DSM IV*) diagnosis of a paraphilia are retained in *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition (*DSM-5*) and include recurrent, intense sexually arousing fantasies, sexual urges, or behaviors generally involving (1) nonhuman objects, (2) the suffering or humiliation of oneself or one's partner, or (3) children or other nonconsenting persons, that occur over a period of at least 6 months (Criterion A). For some individuals, paraphilic fantasies or stimuli are obligatory for erotic arousal and are always included in sexual activity. In other cases, the paraphilic preferences occur only episodically (e.g., perhaps during periods of stress), whereas at other times the person is able to function sexually without paraphilic fantasies or stimuli. The behavior, sexual urges, or fantasies cause clinically significant stress or impairment in social, occupational, or other important areas of functioning (Criterion B) (APA 1994).

The *DSM-5* distinguishes paraphilia, a recurrent and intense sexual arousal to atypical objects or activities manifesting in the form of sexual fantasies, urges, or behavior, from paraphilic disorders (which is paraphilia accompanied by clinically significant distress or impairment). Consequently, establishing a diagnosis of paraphilia is not sufficient to diagnose paraphilic disorders.

DSM-5 described eight specific types of paraphilias: voyeuristic disorder (spying on unsuspecting strangers in normally private activities), exhibitionistic disorder (exposing the genitals to unsuspecting stranger), frotteuristic disorder (touching or rubbing against unconsenting person), sexual masochistic disorder (experiencing humiliation, bondage, or suffering), sexual sadism disorder (inflicting humiliation, bondage, or suffering), pedophilic disorder (preference for prepubescent children), fetishistic disorder (nongenital body parts or nonliving objects), and transvestic disorder (cross dressing). Other rare paraphilias are classified as other specified paraphilic disorder if the atypical sexual focus is known, or unspecified paraphilic disorder if the symptoms are characteristic of paraphilic disorder but the focus is unknown or the clinician chose not to specify.

A simple way of considering the spectrum of the paraphilias is to consider them as "hands-on" and "hands-off" paraphilias. The "hands-on" paraphilias involve some physical contact with either a consenting or a nonconsenting partner, and would include pedophilic disorder, sexual sadism, sexual masochism, and frotteurism. Zoophilia and necrophilia classified under the section "Other Specified Paraphilic Disorder" of *DSM-5* would also be included in this group. The "hands-off" paraphilias are the remaining paraphilias and include exhibitionism, voyeurism, fetishism, transvestitic fetishism, and the remaining paraphilias in the "Other Specified Paraphilic Disorder and Unspecified Paraphilic Disorder" grouping. There was an idea in the past that the presence of a "hands-off" paraphilia meant less concern than the presence of a "hands-on" paraphilia, but this is now rejected because of the well-documented crossover between the various paraphilias (Firestone et al. 2006). The primary paraphilia is simply to be regarded as a presentation of one aspect of a spectrum of paraphilic behaviors in any individual. Most often, this would overlap between "hands-on" and "hands-off" paraphilias.

ASSESSMENT

The treatment of sexual offenders therefore has to take all this into consideration, and means that a detailed and extensive assessment of sexual behaviors is necessary. As with other psychiatric conditions, the success of treatment is dependent on a detailed assessment to establish the correct psychiatric diagnosis. Most frequently, sexual offenders and others with paraphilias are evaluated in specialized sexual behaviors clinics (Bradford 1988, 2001). The comprehensive multimodal sexual behaviors clinic evaluation typically would consist of

1. A full psychiatric evaluation
2. A medical evaluation as necessary
3. A sex hormone profile and general biochemistry
4. Sexual questionnaires
5. Objective measures of sexual interest, specifically penile plethysmography and visual reaction time
6. Recidivism Risk Assessment

Table 81.1 describes the essential components of the evaluation and their purpose.

This baseline evaluation can be used to measure treatment outcome. The measures that are most sensitive to treatment outcome are the level of deviant arousal, the type and level of sexual fantasies, the levels of sex hormones in treatment with an anti-androgen medication, as well as cognitive distortions. There are sets of variables that are associated with an increased risk of recidivism (Hanson and Bussiere 1998). Positive treatment outcome with a reduction of sex offense recidivism is clearly the aim of the treatment.

The recidivism risk would be based on actuarial instruments such as the Psychopathy Checklist Revised Edition (Hare 1990); the Rapid Risk Assessment of Sexual Offender Recidivism (RRASOR) (Hanson 1997); Static 99 (Hanson and Thornton 1999); and various other actuarial instruments used to estimate the probability of recidivism. These instruments must be used with caution because of their limitations. Combining risk assessment tools does not improve accuracy of prediction in sex offender population. It may give the false impression that more is better. However, combining actuarial/static measure of risk with a dynamic measure (e.g., Static-99R with Stable 2007) may be complementary because each of the two measure different risk domains (Seto 2005).

TREATMENT

The treatment of sexual offenders includes both psychological and pharmacological treatments. Psychological treatments usually use a cognitive behavioral model and most commonly a relapse prevention approach. The two approaches complement each other and should be offered jointly.

Although there is no clear evidence that sexual offenders or paraphilic males have an increased sexual drive, in theory the principal aim of psychopharmacological treatment is the reduction in sexual drive (Turner et al. 2014). It is assumed that a reduction in sexual drive will result in a reduction in deviant sexual behavior (Bradford 1985; Kingston et al. 2012). Sexual drive is multidimensional and consists of sexual fantasies, sexual urges, and sexual behavior. In the case of a sexual deviation, the sexual fantasies and urges are mostly deviant in line with whatever paraphilia is present, although nondeviant fantasies are also present. The sexual urges and fantasies are in the direction of the erotic preference of the individual (for example, these would be toward young children in the case of pedophilia). The sexual drive can be eliminated to create an asexual individual who would have almost no sexual fantasies or sexual urges. With the increase in sophistication of psychopharmacological agents that can be used in the treatment of sexual offenders, it is now possible to titrate the level of sexual drive. At the same time, the sexual drive can be objectively monitored by sexual arousal testing, hormonal levels, and levels of sexual fantasies and measures of sexual behavior. This means that in most instances the sexual drive would be lowered only

Table 81.1 Purposes and essential elements of comprehensive evaluation of sex offenders

Elements	Purpose	Content/examples
Full psychiatric evaluation		

• General psychopathology
  • Clinical history
  • Measure of comorbidity
• Specific psychopathology
  • Sexual history and functioning
  • Paraphilias
	Symptoms/criteria diagnostic clarification
	Sexual interests/fantasies
	Cognitive distortions and paraphilic interests
		• Symptom review
		• Paraphilia or paraphilic disorders
		• Co-occurring mental disorder
		• Co-occurring physical health
		• Forensic history including motives
		• Collateral history
		• Strengths/weakness/protective factors
		• Mental State Examination
		• Screening for substance use (e.g., MAST and DAST)
		• Personality assessment (e.g., MMPI)
		Self-rating/inventories:
		• Bradford Sexual History Inventory (BSHI)
		• Multidimensional Inventory of Development, Sex, and Aggression (MIDSA)
		• Clarke Sex History Questionnaire for Males-Revised (SHQ-R)
		• Multiphasic Sex Inventory (MSI)
		• Sexual Experience Survey (SES)
		• Severe Sexual Sadism Survey (SSSS)
		• Kurt Freund Paraphilia Scales
		Clinician rating:
		• Screening Scale for Pedophilic Interests (SSPI)

Biological evaluation		

• General
  • Baseline workup
• Specific
  • Hormones
	Comorbidities and baseline status
	Sex hormones
		• Establish baseline Liver function test, thyroid function test, etc.
		• Establish a baseline for pharmacotherapy
		• Establish abnormal hormone levels are present and follow up

Psychophysiological evaluation		
• Phallometry • Viewing Time	Response to sexual stimuli	• Relative sexual arousal to atypical sexual focus or foci (children in pedophilia, sexual coercion and violence in rapists, sexual sadism, biastophilia)
Risk assessment		
• Clinical risk • Actuarial risk • Psychopathy	Measure of recidivism Measure of psychopathy	**High-risk recidivism clinical factors** • Youth, past sex offenses, extrafamiliar victims, stranger victims, noncontact offenses, male victims, multiple victims, past criminal records, anti-sociality, violation of parole, abnormal phallometrics • Static 99R/Static 2002R • Violent Risk Appraisal Guide-Revised (VRAG-R) • Violent Risk Appraisal Guide (VRAG)/Sex Offender Risk Appraisal Guide (SORAG) • Rapid Risk Assessment of Sexual Offender Recidivism (RRASOR) • Minnesota Sex Offender Screening Tool-Revised • Stable 2007 • HCR-20 • Child Pornography Offender Risk Tool (CPORT) (Child Pornography Offender only) • Hare Psychopathy Checklist-Revised (PCL-R)

partially to reduce deviant arousal and fantasies while enabling the individual to perform sexually in nondeviant situations. Ideally if a treatment were to be successful, the sexually deviant behavior would be completely suppressed while the normophilic (nondeviant behavior) would remain intact or even be enhanced (Bradford and Pawlak 1993a).

The pharmacological treatments of the paraphilias are well established (Bradford 2001), and this approach has been shown to be successful in all types of paraphilias. It is also arguably an economical approach to treatment as the paraphilias are usually present in multiple forms and a psychopharmacological treatment would suppress all of those paraphilias present. The psychopharmacological treatment of sexual offenders is focused on the paraphilias that are present.

BIOLOGY OF SEXUAL BEHAVIOR

Sex is a basic biological drive, and the psychopharmacological approach to the treatment of the paraphilias is based on this understanding.

Sexual behavior is affected by two types of hormones:

- Steroid hormones (e.g., estradiol, testosterone, and androstenedione) (Bancroft 2002, 2005; Krueger et al. 2009)
- Peptide hormones (e.g., gonadotropin-releasing hormone [GnRH], gonadotropins, and prolactin) (Rubinow and Schmidt 1996; Owens et al. 2000; Bradford and Fedoroff 2009)

TREATMENT ALGORITHM

A treatment algorithm was developed by Bradford (Bradford 2000, 2001) based on the psychopharmacological effect on human sexual behavior by various drugs, as well as a clinical classification of the severity of the paraphilias. Sexual offenders with a paraphilia, (or a paraphilic disorder in *DSM-5*), would be eligible for psychopharmacological treatment based on this clinical algorithm. Paraphilia severity varies according to type, but it is clear that when victimization of third parties occurs, the condition is more serious than when there is no such victimization. As most sexual offenders have paraphilias/paraphilic disorders that involve the victimization of third parties, such a situation applies to this patient group. Clinical experience in evaluating and treating the paraphilias/paraphilic disorders is important in order to use this classification successfully, with primary paraphilia severity being classified as

- *Mild*: Exhibitionism, voyeurism, fetishism, "hands-off" paraphilias (with the proviso that comorbid paraphilias were also of a "hands-off" type), and mild cases of pedophilia (where deviant sexual fantasies and urges are present but no victimization). Deviant sexual preference as measured by sexual arousal tests would show pedophilic arousal, but not arousal to coercive or sexually sadistic stimuli.
- *Moderate*: "Hands-off" paraphilias where the control over sexual urges was poor and the risk of "hands-on" paraphilias was a concern. Exhibitionism where the target of the exhibitionistic behavior was a child would be an example. In "hands-on" cases such as pedophilia, there would be a low number of victims (less than three) and the level of victimization would be confined to fondling (no penetration). Sexual arousal testing would show a deviant sexual preference to pedophilia, but there would not be arousal to coercive stimuli or sexual sadism or clinical evidence of sadism being a problem.
- *Severe*: Only the "hands-on" paraphilias. This would be pedophilia with more than three victims and an increased level of intrusive sexual behavior beyond simple fondling, where there has been sexual penetration of the victim. There would be deviant sexual arousal to pedophilia on testing and there may be mild coercive arousal but no explicit evidence of sexual sadism in either testing or the clinical history.
- *Catastrophic*: Only "hands-on" paraphilias would be classified in this way. There would be clear evidence of sexual sadism, in terms of fantasies, urges, and behavior directed toward victims. There may not have been victimization, or victimization is denied but the consequences of victimization would be extreme such as death, or severe injury, and the level of control over deviant sexual impulses would be weak. If no victimization was present, there would be evidence of predatory stalking with homicidal urges and homicidal and torture fantasies. If victimization has occurred it would be severe in its degree of sexual and associated physical violence. Sexual arousal shows sexually sadistic arousal and high levels of coercive arousal toward either adults or children.

In order to use this classification guideline correctly, training in the paraphilias/paraphilic disorders is essential. This is because paradoxical situations arise where it would be difficult to classify sexual offenders. For example, a pedophile who only engaged in minor fondling (only outside of the clothes in a way that was made to look accidental) would be pedophilic toucherism (a variant of frotteurism). Although the numbers of victims may be higher than three, the condition would still be classified as moderate.

The algorithm of psychopharmacological treatment follows the classification of severity of the paraphilia in order to select the degree of intervention. The degree of psychopharmacological intervention would increase according to the severity of the paraphilia, with the highest level being equivalent to surgical castration. The aims of psychopharmacological treatment would be to

1. Suppress deviant sexual fantasies
2. Suppress deviant sexual urges and behavior
3. Reduce sexual offense recidivism

The algorithm for psychopharmacological treatment of the paraphilias is

- *Level 1*: Cognitive behavioral treatment; relapse prevention treatment would be always given regardless of the severity of paraphilia.
- *Level 2*: Pharmacological treatment would always start with selective serotonin reuptake inhibitors (SSRIs).
- *Level 3*: If SSRIs are not effective at adequate dose, then low dose of oral anti-androgen would be added (e.g., sertraline 200 mg p.o. daily and 50 mg MPA daily).
- *Level 4*: Full oral anti-androgen treatment (e.g., 50–300 mg MPA daily or 50–300 mg cyproterone acetate [CPA] daily).
- *Level 5*: Full anti-androgen treatment given intramuscularly (e.g., 300 mg MPA IMI every 1 to 4 weeks, or 200 mg CPA IMI every 2 weeks).
- *Level 6*: Complete androgen suppression due to CPA i.m. 200–300 mg per week, or a LHRH agonist (e.g., leuprolide acetate or goserelin acetate).

The impact of psychopharmacological intervention on sexual behavior at the various levels of the algorithm is as follows:

- *Level 2*: Suppression of deviant sexual fantasies, urges and behavior would occur, with a minor impact on overall sexual drive, allowing normal sexual activity to occur.
- *Level 2–3*: Suppression of deviant sexual fantasies, urges and behavior with a moderate reduction in sexual drive would be expected. Normal sexual behavior would occur, but at low level. A dose-dependent response would be expected.
- *Level 4–5*: Suppression of deviant sexual fantasies, urges and behavior with a severe reduction of sexual drive would be expected. Normal sexual behavior may occur, but at a very low level.
- *Level 6*: Complete suppression of sexual drive would be expected.

Subsequently, a Task Force of the World Federation of Societies of Biological Psychiatry published guidelines for the biological treatment of the paraphilias, specifically focusing on adult males (Thibaut et al. 2010). These guidelines were based on review of the scientific literature from 1969 to 2009 related to the pharmacological and biological treatment of sexual deviation, and also classified the literature according to an evidence-based scheme.

Each treatment was evaluated with respect to the strength of evidence for its efficacy, safety, tolerability, and feasibility. The described level of evidence was Level A, Level B, Level C, and Level D which were defined as the generally accepted definitions of an evidence-based approach to treatment (Thibaut et al. 2010).

The critical importance of the World Federation of Societies of Biological Psychiatry is that the pharmaceutical industry, in general terms, is not committed to having drugs approved for the treatment of paraphilias/paraphilic disorders (Bradford 1998). This means that most of the pharmaceutical agents used in their treatment are prescribed "off label." The World Federation review of the pharmacological treatment of sex offenders and people with paraphilias/paraphilic disorders based on evidence-based criteria is critical because it provides a justification for using these medications "off label."

The task force also in a more limited way reviewed the evidence for using general psychotropic medications, which is important when it comes to treating sexually deviant behavior associated with major psychiatric illness such as schizophrenia or bipolar disorder. The treatment of mentally abnormal sexual offenders would fall into this category. Unfortunately the level of evidence for the use of psychotropic drugs to reduce sexual drive is limited, with a lack of controlled studies, and would fall into a category of "No level of evidence or Good Clinical Practice." Nonetheless, using basic principles, the appropriate psychopharmacological treatment for psychosis can be modified to enhance sexual drive, reducing effects while still providing effective treatment for psychosis (Thibaut et al. 2010). Lithium carbonate, tricyclic anti-depressants, and anti-psychotics (thioridazine, haloperidol, and risperidone) have all been used in the past to suppress sex drive (Thibaut et al. 2010). Atypical anti-psychotics with activity at serotonin receptors could be selectively used in conjunction with the treatment of a major psychiatric illness with some degree of sex drive suppression indicated.

The Task Force also developed an algorithm of pharmacological treatment of the paraphilias/paraphilic disorders based on the review.

The algorithm is as follows:

Level 1:
- Aim: control of paraphiliac sexual fantasies, compulsions, and behaviors without impact on conventional sexual activity and on sexual drive
- Psychotherapy (preferentially cognitive behavioral therapy is available [Level C]: no level of evidence for other forms of psychotherapy)

Level 2:
- Aim: control of paraphiliac sexual fantasies, compulsions, and behaviors with minor impact on conventional sexual activity and on sexual desire
- May be used in all mild cases ("hands-off" paraphilia is with lower risk of sexual violence, i.e., exhibitionism without any risk of rape or pedophilia)
- No satisfactory results at Level I
- SSRIs: increase the dosage at the same level as prescribed in OCD (e.g., fluoxetine 40–60 mg/day or paroxetine 40 mg/day (Level C)

Level 3:
- Aim: control of paraphiliac sexual fantasies, compulsions, and behaviors with a moderate reduction of conventional sexual activity and sexual desire
- "Hands-on" paraphilias with fondling but without penetration

- Paraphiliac sexual fantasies without sexual sadism
- No satisfactory results at Level 2 after 4–6 weeks of SSRIs at high dosages
- Add a low dose of anti-androgen (e.g., cyproterone acetate 50–100 mg/day) to SSRIs (Level D)

Level 4:

- Aim: control of paraphiliac sexual fantasies, compulsions, and behaviors with a substantial reduction of sexual activity and desire
- Moderate and high risk of sexual violence (severe paraphilias with intrusive fondling with limited number of victims)
- No sexual sadism fantasies and/or behavior (if present: go to Level 5)
- Compliant patient, if not use IM form or go to Level 5
- No satisfactory results at Level 3
- First choice: full dosage of cyproterone acetate (CPA): oral, 200–300 mg/day or IM 200–400 mg once weekly or every 2 weeks; or medroxyprogesterone acetate: 50–300 mg/day if CPA not available (Level C)
- Possibility of comorbidity with anxiety, depressive, or obsessive-compulsive symptoms, then SSRIs might be associated with cyproterone acetate

Level 5:

- Aim: control of paraphiliac sexual fantasies, compulsions, and behaviors with an almost complete suppression of sexual desire and activity
- High risk of sexual violence and severe paraphilias
- Sexual Sadism fantasies and/or behavior or physical violence
- No satisfactory results at Level 3
- Long-acting GnRH agonists, i.e., triptorelin or leuprolide acetate 3 mg/month or 11.25 mg IM every 3 months (Level C)
- Testosterone levels measurements may be easily used to control the GnRH agonist treatment observance if necessary
- Cyproterone acetate may be associated with GnRH agonist treatment (1 week before and during the first month of GnRH) to prevent flare-up effects and to control the relapse risk of deviant sexual behavior associated with the flare-up effect

Level 6:

- Aim: control of paraphiliac sexual fantasies, compulsions, and behaviors with a complete suppression of sexual desire and activity
- Most severe paraphilias (catastrophic cases)
- No satisfactory results at Level 5
- Used anti-androgen treatment, i.e., cyproterone acetate (50–200 mg/day per os or 200–400 mg once weekly or every 2 weeks IM) or, medroxyprogesterone acetate (300–500 mg/week IM if CPA not available) in addition to GnRH agonists (Level D)
- Also may add SSRIs (No level of evidence) (Thibaut et al. 2010)

The psychopharmacological and psychological treatment of sexual offenders can fail or be undermined by the abuse of substances, disturbances in mood or the development of a concurrent psychiatric disorder, and noncompliance with the psychopharmacological treatment and associated cognitive behavioral treatment. As a result, close monitoring of the patient should be carried out, including

- Sex hormone monitoring in hormonal and anti-androgen treatment
- Random urine screening for substances; random breathalyzer monitoring for alcohol and possibly alcohol sensitization medication in high-risk cases
- Close psychiatric monitoring with fantasies checklists, sexual arousal tests
- Close psychiatric monitoring for the development of depression or other psychiatric disorders

SEXUAL OFFENDER RECIDIVISM

Historically, surgical castration had been used for the treatment of severe paraphilias, mostly sexual sadism and pedophilia, with those individuals who were castrated being high-risk, highly recidivating sexual offenders. Surgical castration resulted in a reduction of recidivism from over 60% to less than 5% in the majority of cases, as reported in several studies. Ultimately, it was the understanding of the biological mechanism by which surgical castration impacted deviant sexual behavior that drove the development of anti-androgen treatment for paraphilias.

A full review of sexual offender recidivism is beyond the scope of this chapter. However, a meta-analysis by Alexander (1997) reported that exhibitionists and pedophiles treated with psychological treatments had lower rates of recidivism than untreated controls. Studies of recidivism using the anti-androgen CPA over one to five years (when corrected for compliance and dosage) showed results similar to those achieved with surgical castration (Bradford 1995).

SELECTIVE SEROTONIN REUPTAKE INHIBITORS (SSRIS)

The treatment of paraphilias/paraphilic disorders has used drugs that affect serotonin (5HT) Basically, an increase in brain levels of 5HT reduces sexual drive and behavior. Although sexual behavior in humans is always regarded as being much more complicated than in animals, drugs affecting 5HT levels were regarded as useful to treat sexually deviant behavior by suppressing sexual drive (Greenberg and Bradford 1997).

A series of case reports starting in 1990 showed that SSRIs had an effect on deviant sexual behavior. Bradford et al. (1995) reported on a 12-week open-label dose-titrated study of pedophilia ($n = 20$) using sertraline, with the mean effective dosage being 131 mg/day. Some 86% of patients completed the study, and no patient was discontinued due to inadequate treatment response. A high proportion (86%)

of patients were rated as responders, with various sexual behaviors being significantly reduced during the duration of the study, while heterosexual coitus actually showed a small increase. Physiological measures of sexual arousal showed decreases in pedophilic arousal and improved or maintained normophilic arousal. This study showed evidence of improvement of normophilic behavior measured as both self-report and sexual arousal.

Greenberg et al. (1996) completed a retrospective comparison study with 3 serotonin reuptake inhibitors and found all of them had an effect on sexual drive, sexual fantasies and urges and none of them were superior to the other drugs. The drugs involved were fluoxetine, fluvoxamine, and sertraline. Later, Greenberg and Bradford (1997) compared paraphilic males ($n = 95$) treated with SSRIs to a control group ($n = 104$) who only received psychological treatment over a 12-week period. The SSRI-treated subjects showed a significant reduction in deviant sexual fantasies compared to those who received only psychotherapy.

The effectiveness of SSRIs in the treatment of sexual offenders requires further investigation, including the use of double-blind treatment. At the same time, the role of serotonin in sexual behaviors has been well established. As both the paraphilias and obsessive–compulsive disorder respond to SSRIs, it has been speculated that these two psychiatric conditions might have a similar basis, as well as certain similarities in their clinical characteristics. Indeed, it has been hypothesized that the paraphilias may be part of an obsessive–compulsive spectrum of disorders (Bradford 1999).

The SSRIs offer an approach to treatment that is useful for most paraphilic disorders of mild or moderate severity. The low side-effect profile and the lack of any hormonal effects, mean that they can be used to treat adolescent sexual offenders. This is important, as most paraphilias begin in adolescence with deviant sexual fantasies and urges, while the actual sexual acting starts later, mostly from the age of 20 years onward. Early diagnosis and treatment of the condition during adolescence can have a major impact on future victimization, and the SSRIs are playing an increasing role in this treatment approach.

HORMONAL AGENTS

The first psychopharmacological agents used to reduce sexual drive were estrogens, and clinical studies showed the treatment to be successful via the reduction of circulating testosterone. However, the adverse side effects of nausea, vomiting, and feminization were problematic and limited the use of estrogens.

Medroxyprogesterone acetate (MPA) has been the most widely used psychopharmacological agent for treatment of sexual offenders in the United States. Most studies have shown a positive treatment response of sexually deviant behavior to MPA.

The mechanism of action of MPA is via the induction of testosterone-alpha-reductase in the liver. This increases the metabolic clearance of testosterone, thereby reducing its plasma levels. MPA also has a progestinic effect that leads to a reduction in the secretion of gonadotropins. Moreover, MPA does not compete with androgen receptors at the receptor level, and so by definition is not a true anti-androgen (Southren et al. 1977). Treatment with MPA results in side effects, including weight gain, decreased sperm production, a hyperinsulinic response to a glucose load that might lead to potential problems in patients with diabetes mellitus, headaches, deep vein thrombosis, hot flushes, nausea, and vomiting—all of which can be managed medically. At the same time, a significant impact on sexual behavior was observed, including a reduction in sex drive, sexual fantasy, and sexual activity (Berlin and Meinecke 1981; Gagne 1981; Walker and Meyer 1981).

Clinic studies with MPA are mostly open trials. Initially, MPA was used in the treatment of paraphilic males. The two best-known open clinical studies were completed by Berlin and Meinecke (1981) and Gagne (1981). The two studies included about 70 patients, and each showed MPA to be effective treatment provided that the subjects were compliant with dosing as there was a tendency toward significant relapse rate if treatment was discontinued. Meyer et al. (1992) studied 40 men (mostly pedophiles) treated with MPA (400 mg per week, intramuscularly), and group and individual therapy followed-up for up to 12 years. A control group of 21 persons who were treatment refusers was included, and they were treated with psychotherapy over the same follow-up period. Some 18% reoffended while on MPA, and 35% reoffended after MPA was discontinued. In the control group, 58% relapsed, with raised baseline testosterone levels, head injury, and alcohol and substance abuse being factors associated with relapse.

MPA is a widely used psychopharmacological treatment with few reported serious side effects that could be a barrier to treatment, and the impact on recidivism has been shown in a number of studies, provided that the sexual offender remains on MPA. However, in long-term treatment with MPA with concomitant low levels of plasma testosterone, it is important to monitor for osteoporosis; at the earliest signs of osteopenia, both calcium and vitamin D supplements should be added to the treatment regimen.

LUTEINIZING HORMONE-RELEASING HORMONE AGONISTS

Luteinizing hormone-releasing hormone (LHRH) agonists have a specific treatment role in the paraphilias in that they produce a pharmacological "castration." The hypothalamic pituitary axis is overstimulated and is exhausted, and there is a significant inhibition of gonadotropin secretion. LHRH agonists have a prolonged action and may potentially be important in the future treatment of severe paraphilias. The potential use of these drugs to treat paraphilias was first described by Bradford (1985); since then limited clinical studies have been conducted on the use of LHRH agonists in this population.

The most important study to date in relation to the treatment of paraphilias with LHRH agonists was reported by Rosler and Witztum (1998). This was an uncontrolled open

study of the treatment of 30 men who suffered from long-standing severe sexual deviation; 25 of the men experienced pedophilia. They were treated with monthly injections of 3.75 mg triptorelin and supportive psychotherapy for a follow-up period of 8–42 months, with treatment outcome being evaluated monthly by questionnaire. All of the men had a decrease in the number of deviant sexual fantasies and urges; quantitatively during therapy, this was reduced to zero. There was also a significant decrease in the number of deviant sexual interests to zero while receiving triptorelin. These effects were observed for at least 1 year in all ($n = 24$) who continued treatment for a year. The plasma testosterone levels fell to castration levels. Side effects were erectile failure, hot flushes, and decrease in bone mineral density. Briken et al. (2001) used leuprolide acetate over a 12-month period to treat sexually deviant males. There was a significant impact on sexually aggressive behavior as well as other sexual behavior. As with surgical castration, the risk of osteoporosis with treatment using a LHRH agonist is significant, and bone density studies should be conducted on an annual basis. Prophylactic treatment with vitamin D and a calcium supplement should be considered.

It is clear that LHRH agonists are going to play an increasingly important role in the treatment of sexual offenders in the future, and further research is needed when using these psychopharmacological agents. Although no outcome studies are available, the effects on available androgen are similar to what is seen in surgical castration. As a result, the outcome of long-term LHRH agonist treatment on sexual offender recidivism should be similar—if not identical—to the surgical castration studies, provided that the treatment is continuous.

LHRH analogues available for clinical use include leuprolide acetate, triptorelin (not available in the United States, but available shortly in Canada), and goserelin acetate.

ANTI-ANDROGENS

Cyproterone acetate (CPA) is a powerful anti-androgen that has been widely used in Canada and Europe, but is not available in the United States. It has anti-androgen, anti-gonadotropic, and also progestinic effects, and has a principal mode of action at androgen receptors throughout the body. It is a true anti-androgen as its mode of action is to block intracellular testosterone uptake and intracellular metabolism of the androgen (Liang et al. 1977). The effects of this medication are largely dose dependent, with sexual behavior decreasing because of a reduction in plasma testosterone as well as receptor blockade. This includes erections, masturbation, sexual intercourse, and deviant sexual behavior (Bradford 1985, 1995). CPA has strong progestational action (Schering 1983), and also blocks or reduces LHRH secretion (Neumann and Schleusener 1980). The full anti-gonadotropic effect of CPA is only seen in females, as in males the anti-androgen and anti-gonadotropic effects balance. The specific mode of action of CPA is competitive inhibition of testosterone and dihydrotestosterone at the androgen receptors. When given orally, CPA is 100% bioavailable and has a plasma half-life of 38 hours. In the intramuscular depot form, maximum plasma levels are typically reached in 82 hours (Neumann 1977; Schering 1983).

The side effects of CPA treatment are similar to those seen with MPA, and there is also a possibility of liver dysfunction and adrenal suppression (Bradford 1995). CPA is the most extensively studied pharmacological agent used to treat paraphilias, with the first clinical studies being conducted in Germany in 1971 in over 100 sexually deviant men (Laschet and Laschet 1971). The subjects were about 50% sexual offenders, and the duration of treatment in an open clinical trial ranged from 6 months to over 4 years. It was documented in 80% of cases that CPA (100 mg per day) eliminated sexual drive, erections, and orgasms, whereas a dose level of 50 mg per day caused a reduced libido but allowed erections to occur and some heterosexual and homosexual sexual behavior to continue weekly. In about 20% of exhibitionists, there was a complete elimination of all deviant sexual behavior, even after treatment was discontinued. This is not completely understood but could be the result of down-regulating androgen receptor sensitivity. Undesirable side effects documented in this study were fatigue, transient depression, weight gain, and some form of feminization including slight gynecomastia. In a subsequent study, Laschet and Laschet (1975) reported on 300 men treated for up to 8 years with an excellent treatment response, with minimal side effects in long-term management being reported. A number of other studies have all shown CPA as effective in reducing deviant sexual behavior. A double-blind placebo-controlled crossover study was completed by Bradford and Pawlak (1993a), while a similar study using CPA and evaluating the effect on the sexual arousal patterns of pedophiles was also reported by the same authors (Bradford and Pawlak 1993b). A single case study was also reported (Bradford and Pawlak 1987) that showed CPA to be an effective agent in the treatment of severe paraphilia—specifically sadistic sexually motivated homicide. In the double-blind, placebo-controlled crossover study of Bradford and Pawlak (1993b), 19 subjects (mostly pedophiles) were studied; all had high pre-treatment recidivism rates with a mean of 2.5 previous convictions per subject, and all met the *Diagnostic and Statistical Manual of Mental Disorders*, 3rd edition, revised (*DSM-III-R*) criteria for a paraphilia. CPA was administered orally in 3-month active treatment phases. There was a reduction in sexual arousal of responses by active drug, but this did not reach statistical significance. Self-report measures of arousal were all significantly reduced, while psychopathology measured by rating scales showed significant reductions, and self-reported sexual activity was significantly reduced. Other objective measures of sexuality including fantasies and masturbation were all significantly decreased by CPA (Bradford and Pawlak 1993a).

CPA is the only pharmacological intervention that has been subjected to research into treatment outcome and recidivism. A number of studies have shown CPA to be effective in reducing post-treatment recidivism rates (Bradford 1995).

Pre-treatment rates of recidivism ranged from 50% to 100%, and the post-treatment rate was 0% in follow-up periods ranging from 1 to 5 years, when adjusted for treatment compliance.

ADOLESCENT SEX OFFENDERS

Although adolescent sex offenders (ASOs) are estimated to account for 12.5% of all arrests for rape and 14% of all arrest for other sex offenses in the United States, there is a dearth of empirical research in this sex offender population (U.S. Department of Justice, Uniform Crime Report 2009). Pullman and Seto (2012) summarize the two perspectives to explain adolescent offending, namely, generalist (sexual offending as manifestation of generalized delinquency therefore not different from non-sex offenders) and specialist perspectives (they differ from other offenders), and therefore required specific assessment and treatment. Meta-analytic study of 3855 male adolescent sex offenders suggests both general anti-social orientation (criminal history anti-social personality, anti-social attitude and beliefs) and sexual deviance (atypical sexual interests, excessive sexual preoccupation, etc.) play similar roles among adolescent sex offenders, while the latter sets them apart from other adolescent offenders (Seto and Lalumiere 2010). Based on this they argue that evaluation of ASO recidivism risk should take into consideration both dimensions and, in keeping with the *Risk Needs Principles* (Andrews and Bonta 2010), this information should inform treatment and supervision intensity. As shown in Table 81.2, the assessment and treatment of adolescent sex offenders must be comprehensive and based on Risk-Need-Responsivity (RNR) principle for effective and efficient overall risk reduction, offender rehabilitation, and safe community.

The report of the World Federation of Societies of Biological Psychiatry Guidelines (WFSBP) for the treatment of adolescent sexual offenders with paraphilic disorders (Thibaut et al. 2016) concluded that in adolescents with paraphilic disorders, cognitive behavioral or multisystemic approaches to treatment should always be the first line of treatment. Furthermore, pharmacological interventions, when deemed necessary, should always be part of a more comprehensive treatment plan including psychological treatments. There are no medications approved for the treatment of adolescent sexual offenders, either in Europe or in North America, which means all pharmacological treatments

Table 81.2 Essential elements in ASO assessment and treatment

Elements	Indications
Elements of ASO assessment:	
Step 1: Assessing risk dimensions	
• Juvenile Sex Offender Protocol II (JSOAP) (Prentky and Righthand 2003) • Estimate of Risk of Adolescent Sexual Offense Recidivism (ERASOR) (Worling and Curwen 2001)	These two scales assess the General Antisocial Orientation and the Sexual Deviance risk dimensions.
Step 2: Evaluation of atypical sexual interests	
• Ask about atypical sexual interests (history or self-report questionnaire) • Sexual Fantasy Questionnaire and Sexual History Form for adolescents (Daleiden et al. 1998)	Identify • Risk to reoffend • Potential critical treatment needs
Step 3: Psychophysiological evaluation	
• Phallometry	• Limited but promising empirical data to support phallometry in the ASOs • Ethical concerns • Limited access
Elements of ASOs treatment	
• Multi Systemic Therapy (MST) (Bordin et al. 2009) • Community services • Functional family therapy	Family oriented, targeting multiple domains: • Family functioning • Social skills • Problem solving • Peer intervention • Academic achievement • Childhood adverse experience (e.g., sexual abuse, etc.) Usually include • Individual Cognitive Behaviour Therapy targeting atypical sexual arousal pattern, excessive sexual preoccupation • Substance use treatment

would be used off label. In general, the main-line treatment approaches for this age group would be cognitive behavioral treatments, family interventions, psychoeducational interventions, and the use of SSRIs. The use of anti-androgens is discouraged prior to age 17. The reason for this is that they could delay the onset of puberty or of bone growth. In fact adolescent sexual offenders need to be considered broadly in two groups based on age: those 18 years of age and older, and those 18 years of age and under (by implication, stage of puberty). For adolescents 18 years or older, the previously published guidelines would apply. For adolescents less than 18 years of age, two groups should be considered: Group I between 12 and 16 years of age; and Group II, 17 and 18 years of age. Group I would still be in an active developmental stage of puberty (between Tanner stages III and V). As part of the psychiatric evaluation, prior to pharmacological treatment, the assessment of the stage of puberty needs to be completed through hormonal levels, x-rays looking at epiphyseal closure, and consultation with a pediatric endocrinologist. This group could be treated with SSRIs taking into consideration the U.S. Food and Drug Administration safety warnings, indicating that the use of anti-depressants may increase the risk of suicidality in youths. In Group II (Tanner stage V) psychological treatments must always be the first line of treatment. If the Tanner V stage is reached, then the adolescent should go through the same evaluation of severity in the WFSBP adult guidelines, and if pharmacological treatment is necessary, the adult guidelines could be followed (Thibaut et al. 2010, 2016). In cases of Tanner IV or below considerations may be given to anti-androgen treatment, but this would have to be at the advice of an expert in adolescent endocrinology. It would also depend on the severity of the risk.

SUMMARY

The psychopharmacological treatment of sexual deviation has a sound basis in the neurobiology of sexual behavior. Compared to other psychopharmacological treatments in psychiatry, more is known of the actual mechanisms of action in these psychopharmacological agents used in the treatment of paraphilias/paraphilic disorders. There is considerable knowledge of the effects of serotonin on sexual behavior in both animal research and clinical studies in men with paraphilias and hypersexuality, as well as treatment of other psychiatric conditions. The anti-androgen and hormonal treatments (CPA, MPA, and LHRH agonists) also have a sound scientific basis in the neuroendocrinology and endocrinology of sexual behavior. The differential effect on sexual arousal patterns documented with CPA and sertraline is a fascinating research finding in both practical and neurobiological terms (Bradford and Pawlak 1987, 1993a,b; Fedoroff et al. 2015). The ideal treatment outcome with a normalization of sexual preference in sexually deviant males is supported by this research finding. The major problem when using the psychopharmacological treatment approach in sexual offenders has been the lack of government and pharmaceutical industry support for research, and this has led to there being a lack of double-blind placebo-controlled studies. Further significant ethical barriers exist because of the risk to third parties, and this has made double-blind, placebo-controlled studies very difficult to complete in sexually deviant men. Moreover, most psycho-pharmacological agents are used in off-label indications. Nonetheless, despite these difficulties, this is an important treatment approach and, when combined with cognitive behavioral treatment and relapse prevention, provides a very powerful tool for the treatment and rehabilitation of sexual offenders.

Further research is clearly needed in all the pharmacological agents, but particularly in the case of SSRIs and LHRH agonists. Interesting future research opportunities are likely to arise when drugs that are highly specific to serotonin subreceptors are developed (e.g., the 5HT1a receptor). This could mean a clinical "mapping" of the behaviors associated with pharmacological activity at a specific receptor, and would mirror research that has been carried out in animals, where sexual behavior is subreceptor-specific in some species.

SUMMARY KEY POINTS

- Very detailed sexual behaviors assessment protocols are available which include objective measures of sexual interest.
- The neurobiology/neurochemistry of sexual behavior is relatively well established in humans and well understood in animal research.
- There is considerable research available into many aspects of deviant sex behavior including assessment, treatment, recidivism, and treatment outcome.
- Well-established, evidence-based pharmacological treatment is available for the treatment of paraphilias/paraphilic disorders in adults. This includes the World Federation of Societies of Biological Psychiatry Task Force Report.
- Recently, treatment guidelines for the treatment of adolescent sexual offenders have been published by the World Federation of Societies of Biological Psychiatry.
- Further research is necessary in the neurochemistry of sexual behavior and the pharmacological treatment of deviant sex behavior.

Torture and psychiatric abuse: Definition, ethics, and assessment

RYAN C.W. HALL AND RICHARD C.W. HALL

INTRODUCTION

Premum non nocere ("first do no harm") has been a tenet of medicine since the days of antiquity. That tenet can become a gray area, especially during times of war, armed conflict, terrorism, and police investigations, where the line between appropriate information gathering/interrogation is crossed and torture begins. The Nuremberg trials of the mid-twentieth century clarified what is and is not the acceptable practice of medicine during times of war, and to whom the physician owes a duty (e.g., the individual, the population, the state) (Trial of War Criminals before the Nuremberg Military Tribunals Under Control Council Law No. 10, II; Vesti et al. 1998, 185). Unfortunately, post-9/11 conflicts have again raised ethical concerns about the physician's role in what is and what is not torture, legitimate interrogation, forensic interviewing, and psychiatric abuse (Pope 2011, 158).

Besides the ethical issues related to torture, there are practical implications of how a forensic psychiatrist might become involved in a legal case of an individual who has been tortured. It is estimated that more than half the countries in the world engage in some form of torture, which results in accusations of torture being raised in many legal settings, such as immigration/asylum cases, human rights cases, civil compensation for acts committed, and the production of false confessions (Istanbul Protocol 2004, 3; Campbell 2007, 628; Carinci et al. 2010, 73; Hall 2012, 446; Pope 2012, 418). Conducting an evaluation on an individual who has been tortured produces its own challenges and implications separate and distinct from those seen in the usual criminal or civil forensic assessment. The examiner needs to understand the common forms of torture, the regional politics where the event occurred, and the unique transference issues such cases produce (Boehnlein et al. 1998, 173; PHR 2001; 35, 75–78; Istanbul Protocol 2004, 25, 50; IRCT 2012, 17–22; Pope 2012, 419, 422).

PSYCHIATRIC ETHICS AND PSYCHIATRIC ABUSE

A brief review of general psychiatric ethics and potential abuse is important because concerns that a psychiatrist encounters in clinical practice, such as confidentiality, agency, inappropriate relationships, interactions with colleagues, and appropriateness of a diagnosis, take on a new significance in the context of torture. (See Table 82.1.)

In general, the American Psychiatric Association (APA) refers psychiatrists to the American Medical Association's (AMA) Medical Code of Ethics as the primary source of medical ethics. The APA also maintains an addendum to the AMA code of ethics entitled, "The Principles of Medical Ethics with Annotations Especially Applicable to Psychiatry." As noted in the preamble, "A [Psychiatrist] must recognize responsibility to patients first and foremost, as well as to society, to other health professionals, and to self" (APA 2013, 2). Critical elements of psychiatric ethics are providing competent professional medical care with compassion and respect for human dignity and rights; not engaging in professionally dishonest or fraudulent behavior; reporting those who do engage in professionally dishonest or fraudulent behavior; respecting the law while at the same time "seek[ing] changes" in those requirements which run contrary to patients' best interests; and an ethical need to "safeguard patient confidences and privacy within the constraints of the law" (APA 2013, 2).

Ideally, physicians should be able to self-regulate/monitor to prevent abuses, but physicians have to also acknowledge that they may have blind spots for when a boundary crossing or violation has occurred or is occurring. General suggestions to reduce the risk of occurrence are maintaining healthy professional relationships (e.g., professional society involvement, supervision, relationship with trusted confidante); avoiding occupational burnout (e.g., maintaining healthy lifestyle, time away, variation in work patterns); being aware of vulnerable times in one's life (e.g., divorce or unhappy marriage

Table 82.1 Types of psychiatric abuse

Violating confidentiality
Inappropriate publishing of information for psychiatrist's benefit
Inappropriate release of information to family, third party, government, or press
Conducting inappropriate relationships with patients
Sexual relationship with current or former patient
Sexual relationship between supervisor/trainee, which can affect supervision of patient
Exploitative for psychiatrist's personal gain
Not informing patient of potential conflicts of interest at start of treatment or when conflict arises
Entering into therapeutic supervisory relationship with other professionals' (e.g., counselor) without actually performing appropriate supervision or review
Conducting evaluations under false pretenses
To obtain a confession
To obtain information for nontreatment purposes such as reprisals
To conduct research without appropriate informed consent
Violating fiduciary responsibility to patient
Treatment decisions for third-party payers' interest rather than patient's
Inappropriately using psychiatric knowledge
Intentionally misdiagnosing a patient to result in confinement, loss of job, discrediting of the individual, loss of rights, limiting of compensation, or to protect others
Intentionally misdiagnosing a patient to benefit the patient, such as disability assessment, civil litigation, avoidance of military service, avoidance of punishment
Making public statements about public/private figures without evaluation and release
Engaging in evaluations that one is not qualified for based on training, education, and experience
Participating in a legally authorized execution
Participating in torture
Providing treatment based on psychiatrist's personal political motivation
Diagnosing and treating to silence political dissent

potentially resulting in higher likelihood of sexual boundary violation); recognizing signs of transference (e.g., strong emotions elicited by a patient); and periodically trying to self-assess potential personal biases (e.g., cultural, religious, political) and how those affect interactions with their patients.

When psychiatric abuse occurs, depending on the severity and clarity of the situation, there may be several avenues to obtain ethical guidance both for the individual who recognizes he or she has committed an abuse and for the observer who has witnessed it, such as institutional committees or professional organizations. As noted in many ethics guidelines, abuses are to be reported to appropriate authorities—which may include professional organizations, state or national medical boards, or governmental departments. In cases of systemic or governmental sanctioned abuses, nongovernmental organizations (NGOs) such as Amnesty International or world governing bodies such as the United Nations or the International Court may also be appropriate avenues for reporting.

DEFINING TORTURE

In the post-9/11 world, various definitions and interpretations of what is or is not torture exist. Common to most definitions is that the act is intentional, that there is an imbalance of power, and that there is the infliction of pain and suffering to a severe degree (Campbell 2007, 630; BCRHHR 2013, 14). This creates a sense of extreme helplessness that leads to a decline in cognitive, emotional, and behavioral functioning (Istanbul Protocol 2004, 45).

Torture is defined by the 1984 UN Convention Against Torture (CAT) as

> [A]ny act by which severe pain or suffering, whether physical or mental, is intentionally inflicted on a person for such purposes as obtaining from him or a third person information or a confession, punishing him for an act he or a third person has committed or is suspected of having committed, or intimidating or coercing him or a third person, or for any reason based on discrimination of any kind, when such pain or suffering is inflicted by or at the instigation of or with the consent or acquiescence of a public official or other person acting in an official capacity. It does not include pain or suffering arising only from, inherent in, or incidental to lawful sanctions. (CAT 1984, Article 1 part 1)

The UN further clarifies that "Torture constitutes an aggravated and deliberate form of cruel, inhuman, or degrading treatment or punishment" as well as being based on all other relevant international instruments (Table 82.2),

Table 82.2 National and international declarations regarding torture that provide definitions and legal frameworks

- Nuremberg Trials (Law No. 10 International Military Tribunal) (1946–1949)
- Article 55 of the Universal Declaration of Human Rights (1948)
- Geneva Convention (1949)
  - Wounded and sick in the field
  - Wounded, sick, and shipwreck at sea
  - Prisoners of war
  - Civilians under foreign power during time of war
- European Convention for the Protection of Human Rights and Fundamental Freedoms (1953)
- UN Article 7 International Covenant on Civil and Political Rights (1966)
- UN Declaration on the Protection of All Persons from Being Subjected to Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment (1975)
- [Intra]American Convention on Human Rights (1978)
- African Charter of Human and Peoples' Rights (1981)
- UN Convention Against Torture [CAT] (1984)
- European Convention for the Prevention of Torture and Inhuman or Degrading Treatment or Punishment (1989)
- Rome Statute of the International Criminal Court (1998)
- U.S. Government Torture Victims Relief Act (1998)

and that "It does not include…lawful sanctions to the extent consistent with the Standard Minimum Rules for the Treatment of Prisoners" (Istanbul Protocol 2004, 1).

Torture committed with the intention of destroying national, ethnic, racial, or religious groups may also be considered an act of genocide (BCRHHR 2013, 15). Under these conditions, the 1998 Rome Statute of the International Criminal Court gives the international court jurisdiction over potential torture cases committed as part of a widespread or systematic attack on a group, or as a war crime under the Geneva Conventions of 1949 and Law Number 10 of the International Military Tribunal used at Nuremberg (Istanbul Protocol 2004, 3, 10). The international court can also claim jurisdiction in cases where the state/government is unable or unwilling to prosecute individuals responsible for torture (Istanbul Protocol 2004, 10).

The United States, in 18 U.S.C. §2340, defines torture as "an act committed by a person acting under the color of law, specifically intended to inflict severe physical or mental pain or suffering (other than pain or suffering incidental to lawful sanctions) upon another person within his custody or physical control" (18 U.S.C. Chapter 113c, Torture). Specifically important to psychiatrists is the further definition of "severe mental pain or suffering," which is defined as the prolonged mental harm caused by or resulting from:

> (A) the intentional infliction or threatened infliction of severe physical pain or suffering; (B) the administration or application, or threatened administration or application, of mind-altering substances or other procedures calculated to disrupt profoundly the senses or the personality; (C) the threat of imminent death; or (D) the threat that another person will imminently be subjected to death, severe physical pain or suffering, or the administration or application of mind-altering substances or other procedures calculated to disrupt profoundly the senses or personality. (18 U.S.C. Chapter 113c, Torture)

ENHANCED INTERROGATION

After 9/11, the wording in 18 U.S.C. §2340 was debated, especially as applied to techniques that became known as "enhanced integrations." A legal justification for use of enhanced interrogation techniques such as waterboarding, sleep deprivation, sensory deprivation, sensory overload, and stress positions was put forth by Jay Bybee in 2002 in a document that became known as the "interrogation opinion" and is part of a larger body of communication known as the "torture memos" (Bybee 2002; Bradbury 2009). In the interrogation opinion, it was argued that although enhanced integration may "generally intend," it did not "specifically intend" to inflict severe physical pain (e.g., equivalent in intensity to the pain accompanying serious physical injury, such as organ failure, impairment of bodily function, or even death) or mental pain (significant psychological harm of significant duration) (Bybee 2002; Bradbury 2009). In 2009, by executive order and a Department of Justice review, opinions issued by the Office of Legal Counsel in regard to interrogations between 2001 and 2009 were withdrawn, superseded, and revoked (Bradbury 2009; Executive Order 13491).

THE PROHIBITED ROLE OF PHYSICIANS IN TORTURE

The World Medical Association (WMA) Declaration of Tokyo 1975 states "physicians shall not countenance, condone or participate in the practice of torture or other forms

of cruel, inhuman or degrading procedures" (WMA 2006). This is similar to the World Psychiatric Association's position in the 1977 declaration of Hawaii, which prohibits the misuse of psychiatric skills as stated:

> The psychiatrist must never use his professional possibilities to violate the dignity or human rights of any individual or group and should never let inappropriate personal desires, feelings, prejudices or beliefs interfere with the treatment. The psychiatrist must on no account utilize the tools of his profession, once the absence of psychiatric illness has been established. If a patient or some third party demands actions contrary to scientific knowledge or ethical principles, the psychiatrist must refuse to cooperate. (WPA 1983)

In the United States, the AMA's position on torture is "Physicians must oppose and must not participate in torture for any reason" (AMA Opinion 2.067 Torture). Participation in torture includes, but is not limited to, "providing or withholding any services, substances, or knowledge to facilitate the practice of torture. Physicians must not be present when torture is used or threatened." The withholding of services becomes a potential double bind for physicians, since treatment may lead to a reduction of suffering, but at the same time can result in someone being made strong enough to undergo additional torture. The AMA acknowledges this with the statement that "Physicians may treat prisoners or detainees if doing so is in their best interest, but physicians should not treat individuals to verify their health so that torture can begin or continue." The AMA further encourages that "Physicians who treat torture victims should not be persecuted," which supports physicians who, in good faith, work in confinement situations and also those who treat the victims of torture after release.

The American Psychiatric Association and the American Psychological Association issued a joint position statement against torture in 1985 (Joint Resolution 1985). In 2006, the American Psychiatric Association issued an additional Position Statement on Psychiatric Participation in Interrogation of Detainees (APA 2006). As used in this statement, "interrogation" refers to a deliberate attempt to elicit information from a detainee for the purposes of incriminating the detainee, identifying other persons who have committed or may be planning to commit acts of violence or other crimes, or otherwise obtaining information that is believed to be of value for criminal justice or national security purposes. It does not include interviews or other interactions with a detainee that have been appropriately authorized by a court or by counsel for the detainee or that are conducted by or on behalf of correctional authorities with a prisoner serving a criminal sentence.

Much like the AMA, WMA, and WPA, it is stated, "Psychiatrists should not participate in, or otherwise assist or facilitate, the commission of torture of any person." It is stipulated that "Psychiatrists who become aware that torture has occurred, is occurring, or has been planned must report it promptly to a person or persons in a position to take corrective action." In addition, sections that are particularly important for a forensic psychiatrist to be aware of include the following:

> No psychiatrist should participate directly in the interrogation of persons held in custody by military or civilian investigative or law enforcement authorities, whether in the United States or elsewhere. Direct participation includes being present in the interrogation room, asking or suggesting questions, or advising authorities on the use of specific techniques of interrogation with particular detainees. However, psychiatrists may provide training to military or civilian investigative or law enforcement personnel on recognizing and responding to persons with mental illnesses, on the possible medical and psychological effects of particular techniques and conditions of interrogation, and on other areas within their professional expertise. (APA 2006)

Although the American Psychological Association is against "torture," there was debate regarding what was permissible involvement in activities such as "enhanced interrogations" (Vasquez 2011). In 2008, the American Psychological Association clarified its statement on torture to be, "Any direct or indirect participation in any act of torture or other forms of cruel, degrading, or inhuman treatment or punishment by psychologists is strictly prohibited" (Kazdin 2008; American Psychological Association 2013). The American Psychological Association specifically identified acts such as waterboarding, sexual humiliation, stress positions, and exploitation of phobias as torture (Kazdin 2008; American Psychological Association 2013).

INAPPROPRIATE WAYS IN WHICH PHYSICIANS CAN BE INVOLVED IN TORTURE

The UN's Manual on Effective Investigation and Documentation of Torture and Other Cruel, Inhuman, or Degrading Treatment or Punishment (AKA Istanbul Protocol) defines physicians' "participation in torture" as follows:

> Evaluating an individual's capacity to withstand ill-treatment; being present at, supervising, or inflicting maltreatment; resuscitating individuals for the purposes of further maltreatment or providing medical treatment immediately before, during, or after torture on the instructions of those likely to be responsible for it; providing

> professional knowledge or individuals' personal health information to torturers; and intentionally neglecting evidence and falsifying reports, such as autopsy reports and death certificates. (Istanbul Protocol 2004, 12)

In general, the fundamental ethics of health care are that actions taken to evaluate, protect, and improve a prisoner's/detainee's health are permissible and encouraged (Istanbul Protocol 2004, 12). Action taken to protect a detainee's health, even if it goes against his or her wishes, such as reporting suicidality, is ethical, but action taken to facilitate punishment or torture is not ethical (Istanbul Protocol 2004, 14–15). Steps physicians can take, especially if they are in a dual-agency situation (e.g., doctor working in a detention facility), to reduce potential ethics violations are as follows: (1) Identify themselves and the potential dual-agency role with the detainee (e.g., detainee's health and safety but also health and safety of others, such as staff and other detainees). (2) Clearly explain the purpose of an evaluation or treatment. (3) Contractually try to maintain professional independence and clinical judgments. (4) Maintain the confidentiality of medical records. (5) Identify and report abuse at the time it occurs or at the earliest time one becomes aware of it and it is safe to do so (e.g., delayed reporting to avoid reprisals against the individual already tortured) (Istanbul Protocol 2004, 13–15).

PHYSICAL ASSESSMENT OF TORTURE

Torture is subdivided into physical, mental, or sexual categories; however, classifying the type may be an academic exercise because many victims suffer multiple forms (Table 82.3) (Carinci et al. 2010, 74; Pope 2012, 419; BCRHHR 2013, 18).

The two most common forms of torture are beatings and threats (Carinci et al. 2010, 74–75; BCRHHR 2013, 18). Depending on the situation under which torture occurs, there may or may not be physical marks. Some who engage in the act will want to leave scars and permanent reminders as warnings to the victims and others. Some who engage in torture may want to inflict pain without leaving physical evidence, which may later result in unwanted investigations (BCRHHR 2013, 18). This may result in beatings taking place with wide blunt objects such as the proverbial rubber hose, or with cloth covering the sites such as thin-soled shoes when beating the feet to limit lacerations (Istanbul Protocol 2004, 31; BCRHHR 2013, 18). These methods may become important factually when conducting the interview of a victim of torture in order to try and determine if the perpetrators were brazen in their conduct and potentially to understand the victim's mentality of being marked or worried if others will believe their accounts without physical marks. In addition, they highlight the need for investigators to understand the common forms of torture, such as water or electrical methods, and ways to maximize the discomfort

Table 82.3 Common forms of torture

- Trauma
  - Beatings (truncheon, sticks, blunt objects)
  - Whippings (wire, cords, whips)
  - Blunt force injuries (punches, kicks, forced falls/drops)
  - Falanga (aka Falaka, Bastinad) beating bottoms of feet
  - Crush injuries (use of hammer on joints/fingers/bones, pliers on genitals)
- Penetrating injuries/disfigurement
  - Cuts
  - Amputations
  - Scarring
  - Items under fingernails
- Burns
  - Heated instruments (cigarettes, hot metal)
  - Fire
  - Scalding liquid
  - Caustic substance (acid, pepper extract)
- Forced positions
  - Suspensions/stretching
    - Cross suspension (tying hands to horizontal bar)
    - Butchery suspension (hanging hands above head)
    - Reverse butchery suspension (feet tied upward/head downward)
    - "Palestinian" suspension (forearms behind the back, with elbows flexed 90° tied to a horizontal bar or tied around the elbows or wrists with the arms behind the back
    - "Parrot perch" suspension (flexed knees from a bar passed below the popliteal region
  - Prolonged constraint
  - Subject to extreme conditions (hot/cold)
- Electrical shocks
- Asphyxiation
  - Strangling
  - Dry asphyxiation (plastic bag over head, smothering)
  - Wet asphyxiation (drowning)
  - Chemicals making it difficult to breathe
- Sexual torture
  - Rape
  - Genital mutilation
  - Irritants (pepper extract, chemicals) on mucus membranes
  - Forced nakedness
- Mental torture
  - Sensory deprivation (isolation, forced bonding with abuser)
  - Direct threats
  - Watching or forced participation in torturing others (family, friends, other detainees)
  - Mock executions
  - Humiliation
- Medical torture
  - Medications (sedation, paralytics)
  - Enucleation
- Violation of social taboos (e.g., sex, violation of dietary laws)

while minimizing the apparent damage by using conducting gels or wet towels (Istanbul Protocol 2004, 40; Carinci et al. 2010, 75). This is why many experts on torture recommend that resources such as the Istanbul Protocol are consulted prior to doing interviews and that one receives training on the topic and familiarizes oneself with common forms of regional tortures. For a more detailed discussion on types of tortures, injuries produced, and marks left, the reader is referred to the Istanbul Protocol, Chapter 5 (Istanbul Protocol 2004, 33–44).

PSYCHIATRIC EFFECTS OF TORTURE ON THE INDIVIDUAL

Torture has numerous physical and psychological effects not only on the individual who experienced it but also on his or her family (e.g., elevated rate of divorce, higher familial rates of mental illness) (Istanbul Protocol 2004, 45; Campbell 2007, 634). The common psychiatric conditions that occur in people who have been tortured include posttraumatric stress disorder (PTSD), depression, and anxiety disorders (Basoglu 1993, 609; PHR 2001, 65; Campbell 2007, 633; Wenzel 2007, 491; NMA 2014). These patients often present with symptoms of diminshed affect, insomnia, avoidance, and memory difficulties (Istanbul Protocol 2004, 45–58; Campbell 2007, 633; Błaż-Kapusta 2008, 5). International literature on torture also refers to the International Classification of Diseases (*ICD*) *10* (2004) diagnosis of Enduring Change of Personality after Catastrophic Experience (F62.0), which is a definite, significant, and persistent change in an individual's pattern of perceiving, relating to, or thinking about the environment and oneself associated with inflexible and maladaptive behaviors not present before the traumatic experience (Norwegian Medical Association 2014). In addition, some of the literature on torture also refers to "complex PTSD" and "Disorders After Extreme Stress NOS" (DESNOS), which are both concepts not currently recognized in *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition (*DSM-5*), but are thought to be a special form of stress sequellae or subset of PTSD (Błaż-Kapusta 2008, 5–6; Carinci et al. 2010, 76; NWA 2014).

Although PTSD and depression are the two most frequent psychiatric disorders found in suvivors of torture, not everyone who has experienced torture will necessarily develop a psychiatric disorder (Basoglu 1993, 609; PHR 2001, 64; Istanbul Protocol 2004, 45). Debate sometimes occurs if certain behaviors are symptoms of mental illness versus being appropriate adaptive/protective responses (e.g., increased vigilance or social isolation during confinement) (Istanbul Protocol 2004, 45; McHugh and Treisman 2007, 212). Poor coping mechanisms such as substance use develop in many victums of torture (PHR 2001, 80). In addition, many people who have been tortured suffer from neurocognitive disorders such as traumatic brain injury and trauma-induced epilepsy (PHR 2001, 86–88; Istanbul Protocol 2004, 55–56; Williams and Amris 2007, 6). This may make it difficult to determine the exact cause of common symptoms such as impaired concentration, memory, executive function, and/or apathy. Neurological damage and deficits can also occur from malnutration (e.g., vitamin B_1, B_6, B_{12} deficiency), forced ingestion of toxic substances, and hypoxia caused by suffocation or drowning (PHR 2001, 43; Istanbul Protocol 2004, 55; Williams and Amris 2007, 6).

In addition, many individuals who have been tortured also present with somatic symptoms including headaches, gastrointestinal complaints, back/muscle pain, and sexual dysfunction (PHR 2001, 68; Istanbul Protocol 2004, 34; Wenzel 2007, 491; Williams and Amris 2007, 5; Carinci et al. 2010, 76; Williams et al. 2010, 718–719; NMA 2014). At times, it may be difficult to tell if these symptoms are due to actual physical trauma (e.g., physical damage to genitalia, chronic pain syndrome related to nerve plexis damage from suspension) or are psychosomatic in origin (Carinci et al. 2010, 75; Williams et al. 2010, 719). Depending on the geographic origin of the person who has been tortured, symptoms may be due to causes such as endemic parasitic infections (e.g., tapeworms, brain parasites) that the evaluator may not normally consider (Pope 2012, 422).

CONDUCTING AN INTERVIEW

Most forensic interviews of individuals who have been tortured seek to obtain specific information related to the torture. (See Table 82.4.) This information can be used for determining compensation, immigration status, future health-care needs, and as the basis for criminal prosecution of others. For that reason, information that should be included in the report includes the circumstances of the interview (e.g., where it occurred, who was present, its purpose), the specifics of the maltreatment (e.g., methods of torture or ill treatment, triggers for the maltreatment, the time when torture or ill treatment was alleged to have occurred, and who was involved or responsible for the maltreatment), and the examinee's physical and psychological symptom/exam findings including supporting documentation (e.g., lab results, x-rays, photos) (PHR 2001, 95–102; Istanbul Protocol 2004, 49–54; Pope 2012, 421; BCRHHR 2013, 62).

It needs to be noted that individuals who have been tortured may have limited knowledge or ability to recount information about their experiences for a multitude of reasons including sensory deprivation (blindfolds), being drugged, loss of consciousness during the torture, or brain damage. Therefore, it may be helpful to ask about all sensory modalities including smell, touch, and taste to help aid in memory retrieval (Istanbul Protocol 2004, 21). They may also lack trust in the evaluator or be fearful that revealing information might jeopardize their safety or the safety of others (Williams and Amris 2007, 6). Psychological factors such as memory loss related to PTSD or coping mechanisms such as denial or avoidance can also limit the amount of information discussed (Campbell 2007, 631). Cultural factors may also limit evaluees from discussing sensitive topics such as sexual abuse (PHR 2001, 33, 54; Istanbul Protocol 2004, 29).

Table 82.4 General information to obtain in an interview regarding torture

1. Circumstances leading up to detention/torture (activities, how detained)
2. Circumstances of detainment facility (food, water, toilets, showers, isolation/crowded, access to family or others outside)
3. Dates and times of the torture including first and last event
4. If exact dates not known, ways individual used to keep track of time and events
5. Locations (may be more than one) where occurred (e.g., detention center, jail/prison, unknown location)
6. Number of times or frequency of torture
7. Types of torture
8. Number and type of people present (e.g., guards, soldiers, police, unknown) including other detainees
9. Objects used and if so how (restraints, car battery, chairs, sticks, medical equipment)
10. Duration of time for which each event occurred (hours, until passed out)
11. Condition at end of session (able to walk, needed to be carried, passed out, how long was affected)
12. Any routine or changes in the routine (new types of experiences, new people)
13. Injuries received at time and current affects
14. Any medical treatment received and by whom
15. Information person was told (no one knows you are here, no one will believe you) or asked about
16. Description of people involved at any stage (e.g., name, rank, organization, sex, distinguishing marks, or mannerisms)

When doing a forensic evaluation on an individual who has been tortured, many of the tenets of a standard forensic psychiatric evaluation still apply, such as identifying oneself, revealing who requested the evaluation, explaining the purpose of the interview, defining the limits of confidentiality, and conducting the interview in as confidential a manner as possible (e.g., no guards in the room or out of earshot at the very least) (PHR 2001, 19–25; Istanbul Protocol 2004, 45–46; IRCT 2012, 14–16; Pope 2012, 419). These interviews can take place under two very broad conditions, either while the person is still confined or post-confinement. If done during periods of confinement, it is highly recommended that individuals performing these types of evaluations have additional training, supervision, and engage in such evaluations as part of a sanctioned team or organization (PHR 2001, 21; Istanbul Protocol 2004, 19, 27; IRCT 2012, 20; BCRHHR 2013, 41). These precautions may protect both the evaluators' and evaluees' safety. If evaluations are done during periods of confinement, the evaluator should plan for multiple interviews if possible to develop rapport, obtain more complete information, and help verify the safety of the evaluee after the initial contact (PHR 2001, 23–25; Istanbul Protocol 2004, 9; IRCT 2012, 24; NMA 2014).

The evalvator may need to make some changes from his or her usual style of interview to help gain the trust of the evaluee and to put him or her at ease. For example, when conducting an interview with someone who has been tortured, extra care needs to be taken to ensure that the individual does not feel like he or she is being "re-interrogated" (PHR 2001, 34–35; Istanbul Protocol 2004, 50; IRCT 2012, 19). To prevent this feeling, standard courtesies are a good place to start but may take on even more significance. For example, starting on time is more important than for most interviews, because many victims of torture are left waiting before a torture session to increase their sense of helplessness, uncertainty, and fear (Istanbul Protocol 2004, 25–27, 50; Pope 2012, 421). Allowing the evaluee to have some control of the interview such as being able to take breaks when he or she wants, stopping the interview to be continued another day, and being able to decline answering questions is important to help distinguish between past interrogations and the current interview (Istanbul Protocol 2004, 50–51). Traditional "emotionally neutral" styles of psychotherapeutic interviews should generally be avoided with survivors of torture, because it may remind evaluees of being interrogated by a cold authority figure, or alternatively that he or she is not being believed (Istanbul Protocol 2004, 50). The interview should not be rushed to avoid recreating past interview scenarios where rapid questions or other pressure techniques were used. Use of open-ended questions that allow the person to tell his or her story is important, as well as allowing the person some latitude in the intial topics discussed, such as superficial or seemingly unrelated topics (e.g., sports, holidays, happier times) to gain comfort. The evaluator should try to avoid leading questions, where possible. For example, an open-ended nonleading question would be "what happened to you?" or "what was your experience at xxx location?" rather than "were you tortured at XXX location?" (Istanbul Protocol 2004, 34).

At times, evaluators may need to ask questions in a tactful or face-saving way. For example, some people may be ashamed of what they did, admitted to, or for having implicated others. For that reason, it may be better to approch topics from a positive perspective, such as asking, "How did your release come about?" instead of "How did you stop the torture?" Other open-ended questions include, "Why do you think you were detained?" or "Why do you think it happened?" This approach may allow the evaluator to obtain information about what activity the individual was involved in, such as political causes, without asking about ideology.

Some individuals who have been tortured may find it difficult to talk about the torture, but may be more willing to indicate what happened to them in writing or using a

checklist/questionnaire. Depending on the nature and location of the interview, an evaluator may want to use these types of instruments (Istanbul Protocol 2004, 53; Campbell 2007, 631; IRCT 2012, 20).

It is important to remember that, although the subject of the interview may be different from a standard forensic evalution, it should still be an objective forensic interview (Istanbul Protocol 2004, 18, 26, 50; IRCT 2012, 15, 17). Some guidelines suggest that the evaluator present himself or herself as an advocate for the evaluee. Care needs to be taken with this approach because it may result in the evaluee becoming suspicious of the evaluator's motives or fearful that he or she will overexpose himself or herself. In addition, the evaluee may assume a greater degree of safety than the evaluator can actually provide after the interview ends (PHR 2001, 23, 24; Istanbul Protocol 2004, 50–52; IRCT 2012, 19).

The evaluator should not overidentify with the individual who is alleging torture. Overidentification can result in important fact-finding questions not being asked, inconsistencies not being identified or addressed, and the alleged version of events not being carefully evaluated (PHR 2001, 31–32, 75–78; Istanbul Protocol 2004, 51; IRCT 2012, 20; Pope 2012, 419). In addition, overidentification can lead to countertransference issues, resulting in the evaluator becoming emotionally distraught or detached (Boehnlein et al. 1998, 174–175; PHR 2001, 75–78; Istanbul Protocol 2004, 51; IRCT 2012, 26; Pope 2012, 419). Either reaction can affect the quality of the forensic interview.

Although torture does occur, false allegations of torture and abuse also occur (Hall and Hall 2001, 343; Istanbul Protocol 2004, 53–54). Evaluators should try to determine if the physical and psychological findings are consistent with the alleged torture. False allegations of torture or exaggerations of minor incidents (e.g., circumstances under which pepper spray or forced extraction from cell was used) may be borne out of a desire for personal gain (e.g., gaining asylum), for political reasons, for revenge, and/or to hide crimes committed by the evaluee (Hall and Hall 2001, 345; Istanbul Protocol 2004, 54). In addition, especially with individuals with psychotic symptoms, it is important to confirm that claims being made are not just paranoid delusions. This is why, when possible, it is useful to confirm information using multiple sources (e.g., State Department reports, UN reports, Amnesty International reports, Human Rights Watch, other victims from same location) (Allodi 1998, 97; PHR 2001, 37, 100; Istanbul Protocol 2004, 25; IRCT 2012, 17; Pope 2012, 422).

Professional interpreters should be used when the evaluee speaks a different language (PHR 2001, 32; Istanbul Protocol 2004, 30; IRCT 2012, 20). Family should not be used to translate because victims may diminish their experiences to prevent loved ones from being exposed to the details (IRCT 2012; 20; Pope 2012, 420). In addition, families may not report accurately what happened in an attempt to preserve family honor. The evaluator needs to inform the interpreter of the unque challenges of this type of interview (IRCT 2012, 20). It is also important to assess the evaluee's comfort with the interpreter or if the evaluee is worried that information given could lead to reprisals. This is often more of a concern when the interpreter comes from the evaluee's native geographic region. It is usually best to use someone who is not native to where the alleged events took place, but at the same time is familiar with the dialect and customs.

For more in-depth references or general information on how to conduct an examination of an individual who has been tortured, the reader is referred to the Resources in Table 82.5.

SUMMARY KEY POINTS

- The act of torture violates domestic and international laws.
- Physician participation in acts of torture violates professional ethics and is a form of medical/psychiatric abuse.
- Forensic psychiatrists may be asked to conduct an evaluation on a survivor of torture for various legal/forensic concerns, such as asylum hearings, criminal investigations, and civil compensation actions.
- Special accommodations and style of questioning may need to be used when interviewing an alleged victim of torture to obtain needed information and limit or prevent retraumatization.
- Although special considerations may be needed for the interview, it still needs to be objective in nature, and the evaluator needs to be aware of potentially negative countertranference, which can be harmful to the evaluator and the evaluee.

Health care and the courts

GREGORY DAVIS

INTRODUCTION

On March 23, 2010, the Patient Protection and Affordable Care Act (ACA), commonly known as "Obamacare," was signed into law. The law was aimed at providing a form of universal health care in the United States by increasing access to coverage, improving quality and affordability of health insurance, and controlling health-care costs. The ACA sought to achieve these goals through a combination of employer and individual mandates, state and individual subsidies, expansion of public programs, and insurance exchanges. It represents the most significant legislative overhaul of the U.S. health-care system since the passage of Medicare and Medicaid in 1965. With the provisions of the ACA taking effect gradually from 2010 to 2020, outcome measures will be closely scrutinized by the public as well as both major political parties.

This chapter focuses on the provisions of the ACA itself, arguments for why universal health care is thought to be needed in the United States, an overview of the history of universal health care and politics leading to the passage of the ACA, legal challenges, and ramifications as the ACA is implemented throughout the United States.

ARGUMENTS FOR UNIVERSAL HEALTH CARE

Most industrialized countries have some form of universal health care. Canada and the United States had similar health-care systems in the early 1960s; however, Canada now has a universal single-payer health-care system. The Canadian government is committed to providing public funding support if their provinces abide by the guidelines of the Canada Health Act of 1984, which requires universal coverage for medically necessary care of all insured persons. In the United Kingdom necessary health care is provided for free to all permanent residents (NHS Constitution of England 2013). Together with Turkey, the United States is one of two members of the Organization for Economic Co-operation and Development (OECD) that do not have some form of universal health-care coverage (Carey et al. 2009).

The World Health Organization (WHO) ranked the health-care systems of 191 member states in their World Health Report in 2000 (Musgrove et al. 2000). The United States ranked 37th while its expenditure per capita was ranked first. The rankings were based on an index of life expectancy, fair financial contribution, and responsiveness of the health-care system. The OECD has also compared life expectancy versus spending. Data from 2008 indicated that the United States was grossly disproportionate in regard to per capita spending when compared to other member countries. For example, in 2008 the United States spent over $7000 per capita on health care with a life expectancy of around 78 years. In contrast, Canada spent over $4000 per capita with a life expectancy of almost 81 years. Despite a variety of health-care delivery systems, all OECD countries group near Canada on a predictable cost versus life expectancy curve, with the United States as the sole outlier with significantly higher expenditure and little increased life expectancy in return (OECD 2010).

According to the U.S. Census Bureau, 15.3% of U.S. citizens or 45.7 million were uninsured in 2007 (DeNavas-Walt et al. 2007). When compared to Canada, a study in 2006 estimated that U.S. residents were significantly less likely to have a regular medical doctor and more likely to forgo needed medications and have unmet health needs. Uninsured Americans were even less likely to receive needed care (Lasser et al. 2006, 1). Delaying medical care increases illness and costs overall. One study estimated that half of personal bankruptcies involved medical bills (Himmelstein et al. 2005, 63). In 2011, health care consumed 11.2% of the gross domestic product (GDP) in Canada compared with 17.7% of the GDP in the United States (OECD 2013).

Proponents of a universal health-care system in the United States argue that a substantial proportion of the U.S. population is not insured at any one time, increasing illness and cost. Despite spending significantly more money on health care, life expectancy is similar and in

some cases decreased when compared to other OECD countries. Despite having disparate systems, most other OECD countries have some form of universal health care, which proponents argue could increase access to care, improve quality of care, and reduce costs if implemented in the United States.

HISTORY OF UNIVERSAL HEALTH-CARE COVERAGE IN THE UNITED STATES: FROM TRUMAN TO THE ACA

Prior to the 1900s the government did not involve itself in health insurance, leaving the states to allow private and voluntary programs to provide funds. There was not support in the working class for broad socialized insurance. In 1915 the American Association of Labor Legislation led the campaign for health insurance by drafting a model bill offering limited coverage to the working class and those making less than $1200 a year. The ideas in the bill drew debate but failed to create legislation. The discussion resumed during the Great Depression in the 1930s and Franklin D. Roosevelt's presidency. While several bills were created pushing for national health insurance, unemployment took top priority. A conservative resurgence in 1938 made further social innovations difficult (Starr 1982b, 81).

During Truman's presidency in the 1940s, health care received full support from the president and became a focus in national politics. In contrast to previous proposals for national health care, Truman included all classes of society, not just the working class. Truman proposed "the right to adequate medical care and the opportunity to achieve and enjoy good health" in his Economic Bill of Rights. Opponents entangled "socialized medicine" with the Cold War and part of the crusade against the communist influence in America. The American Medical Association (AMA) was against Truman's proposal as members believed that compulsory health care would limit physician autonomy. The AMA spent $1.5 million on lobbying efforts in 1945, which at the time was the most expensive in history. Truman's plan died in congressional committee (Schremmer and Knapp 2011, 400).

After WWII, private insurance systems expanded, providing coverage for union members and other groups that held influence in American politics, undermining a movement for universal health care. In 1958 a proposal was introduced to cover hospital costs for the elderly population already receiving social security. The AMA and various insurance companies were initially against the proposal, arguing that it was compulsory, would reduce quality of care, represented socialized medicine, and was un-American. The public pushed the issue onto the national agenda as care for the elderly was a universal issue that in time would come to affect everyone. The AMA countered with their own insurance proposal, an "eldercare plan" that was voluntary with broad benefits and physician services. The U.S. government broadened its proposed legislation to cover physician services. Hence, Medicare and Medicaid were created as President Johnson signed the legislation into law as the Social Security Amendments of 1965 (Starr 1982a).

In 1974 President Nixon proposed his Comprehensive Health Insurance Plan requiring employers to offer full-time employees broad health coverage. Nixon's proposal included an employer mandate to offer private health insurance. Medicaid was to be replaced with state health insurance plans for all with income-based premiums and cost sharing. Nixon's plan also included coverage for behavioral and mental health. After Nixon's resignation, subsequent presidents and congressmen advanced various bills and proposals for health insurance reform without significant success (Nixon 1974).

The Consolidated Omnibus Budget Reconciliation Act (COBRA) was passed by Congress in 1986. COBRA mandates insurance providers to provide health insurance coverage to individuals leaving employment via their previous employers. COBRA includes the Emergency Medical Treatment and Active Labor Act (EMTALA) as well as amendments to ERISA. EMTALA requires any hospital participating in Medicare to provide emergency health-care treatment to all in need, regardless of citizenship, legal status, or ability to pay (COBRA 1985). With very few hospitals that do not accept Medicare, EMTALA applies to nearly all hospitals. The cost of EMTALA is not covered by the federal government and created fears of a "free rider" problem, where individuals intentionally would go without health insurance knowing that hospitals would be required to treat them under the law (Roy 2012).

President Clinton expanded on Nixon's ideas in 1993 through a health-care reform bill that included a mandate for employers to provide health insurance to all employees through managed competition. Concerns included omission of insurance for the unemployed. Clinton's bill ultimately failed secondary to concerns about increasing complexity, overabundance of government regulation, and a barrage of negative press and advertising from the health insurance industry and conservative groups. Clinton negotiated a compromise with the 105th Congress in 1997 to enact the State Children's Health Insurance Program (SCHIP, now known as CHIP), a federal program that provides matching funds to states for health insurance to families with children.

Critics of an employer mandate argue that a mandate to employers drives up the costs of new hires, discourages new hires, increases unemployment, and increases the cost of running a business overall. With an employer mandate for full coverage, consumers would not be aware of health-care costs, removing any incentive to economize and increasing costs overall. An employer mandate does not address insurance concerns for the unemployed and may make individuals fearful to leave a job if they fall ill, as if they switch plans they could pay higher premiums or be denied coverage altogether (Roy 2012).

Conversely, an individual mandate would address the "free rider" problem created by the EMTALA by requiring individuals to buy their own insurance. An individual

mandate could encourage competition and drive costs down by involving individuals directly benefiting from a plan. In 1989, Stuart Butler proposed a plan that included a provision to mandate all households to obtain adequate insurance. Butler argued that health-care protection is a responsibility of individuals, not businesses. He contrasted the inherent difference between insurance for health care and other material goods. He explained that if a man wrecks his Porsche and does not have insurance, society feels no obligation to repair his car. However, if a man has a heart attack, society will want to care for him regardless of his insurance status. Butler said that a mandate on individuals recognizes this implicit contract and moral obligation from society (Butler 1989).

In contrast to Clinton's proposal, in 1993 congressional Republicans created their own health reform bill using the concept of an individual mandate. They introduced the Health Equity and Access Reform Today (HEART) Act (Senate Bill 1770 1993), which proposed an individual mandate with a penalty provision together with health insurance vouchers for low-income individuals. The individual mandate was eventually removed from the bill.

In 2006 an insurance expansion bill was enacted in Massachusetts with an individual mandate and an insurance exchange under Republican Governor Mitt Romney. The law, officially titled An Act Providing Access to Affordable, Quality, Accountable Health Care, but informally known at "Romneycare," also contained an employer mandate requiring businesses with more than 10 full-time employees to provide health insurance (An Act Providing Access to Affordable, Quality Accountable Health Care 2006). Massachusetts since went from 90% of its residents insured to 98%, the highest in the nation (Massachusetts 2010).

Massachusetts provided a template for subsequent health-care reform bills introduced in Congress, eventually leading to the ACA. In 2007, the Healthy Americans Act (Senate Bill 334 2007) was introduced in Congress and also featured an individual mandate and regulated state-based insurance plans. It died in committee, but many of the sponsors and co-sponsors were involved in the 2008 health-care debate.

As part of the 2008 Democratic presidential primaries, both Hillary Clinton and Barack Obama presented plans to reform health care and to cover the 45 million Americans estimated not to have health insurance at some point in the year. Clinton's initial plan included an individual mandate requiring all Americans to obtain coverage, while Obama's plan involved a subsidy but stopped short of requiring all individuals to purchase insurance.

Obama identified universal health care as one of the stated goals of his administration, and after his inauguration both houses of Congress developed health reform bills. Obama initially did not support an individual mandate, but he was persuaded by congressional Democratic health policy experts that guaranteed issue of insurance to all Americans would require an individual mandate and a community rating of insurees. An individual mandate would also prevent "free riding" as well as adverse selection, where more ill individuals would selectively purchase insurance and increase costs. The drafters also hoped that drawing on bipartisan ideas, such as an individual mandate previously supported by Republicans, would increase the chances of the bill obtaining the necessary votes to pass. Bipartisan support would also increase positive public perception. However, Republican support for the bill and an individual mandate began to wane (Cohn 2010, 16).

In the senate, the ACA began as a revision of H.R. 3590, a bill regarding housing tax breaks for service members. The Republican minority vowed to filibuster any bill that they did not support, meaning 60 votes would be required to obtain passage. During the fall of 2009, a series of political circumstances gave Senate Democrats their sought-after votes and supermajority. The Senate passed the ACA by 60–39 on December 24, 2009. The bill was endorsed by a variety of advocacy groups including the AMA and the AARP. On January 19, 2010, Massachusetts Republican Scott Brown was elected to replace the late Democrat Ted Kennedy. The democratic supermajority in the Senate was lost, complicating the legislative strategy of further reform. The Patient Protection and Affordable Care Act was passed in the House on March 21, 2010, with President Obama signing the bill on March 30.

PROVISIONS OF THE PATIENT PROTECTION AND AFFORDABLE CARE ACT

An individual mandate requires all U.S. citizens and legal residents to have qualifying health coverage. In addition to an approved private insurance policy, qualifying health coverage includes Medicaid, Medicare, or other public insurance programs. Previous individual and group plans prior to March 23, 2010, were "grandfathered" with respect to new benefit standards provided grandfathered plans met minimum requirements such as extending dependent coverage to adult children up to age 26, prohibiting rescissions of coverage, eliminating annual limits on coverage by 2014, eliminating pre-existing condition exclusion by 2014, and eliminating waiting periods of greater than 90 days by 2014.

Those choosing not to have coverage pay a variable tax penalty. For a family this would be up to the greater of $2085 per family or 2.5% of household income by 2016. The mandate penalty will be adjusted for cost of living thereafter. Exemptions from the fine include those with religious objections, American Indians, undocumented immigrants, individuals who have been uninsured for less than 3 months, those for whom the lowest-cost health-care plan would exceed 8% of their income, and those whose income is below the tax filing threshold. In 2013, pursuant to the Supreme Court decision in *National Federation of Independent Business v. Sebelius* (2012), Medicaid-eligible individuals would not have to pay a penalty if their state chose not to expand Medicaid coverage.

The ACA includes an employer mandate where employers with 50 or more full-time employees will pay a penalty if they do not provide affordable and comprehensive health insurance. A full-time employee is considered an individual who works at least 30 hours per week. Part-time employees are partially counted in order to determine the size of an employer's workforce. Employers with more than 200 employees are required to automatically enroll individuals into offered health insurance plans, with the employee able to opt out if desired. As of 2014, implementation of the employer mandate was delayed 1 year.

The ACA offers a sliding scale of tax credits for individuals and families with incomes between 100% and 400% of the federal poverty level when purchasing insurance through an exchange. For example, those with an income of 150%–200% of the federal poverty level would contribute 4%–6.3% of their income. In 2013 a family with an income of up to $94,200 would qualify for a subsidy. Small businesses with no more than 25 employees and average annual wages of less than $50,000 will receive a tax credit.

Health insurance exchanges will be created as an online marketplace where individuals and small businesses can compare policies and purchase coverage. Health insurance policies are to meet minimum standards. Competition and regulations are intended to create transparency, reduce prices, and guarantee a variety of options. Access to coverage through exchanges is limited to U.S. citizens and legal immigrants who are not incarcerated. Four benefit categories—bronze, silver, gold, and platinum—will be offered representing increasing percentage coverage of benefit costs. For example, a silver plan will cover 70% coverage of the benefit costs of the plan.

A catastrophic plan with minimum catastrophic insurance coverage will be offered to those up to age 30. States will be allowed to prohibit plans participating in the exchange from providing coverage for abortions. Medical screenings and preventative care are considered an essential health benefit and cannot be subject to co-payments or deductibles. Examples of such services covered include vaccinations and immunizations, mammograms, colonoscopies, HIV screening, and wellness visits. Contraceptive coverage is also mandated for employers and educational institutions with the exception of religious organizations.

With the exception of "grandfathered" plans, new insurance plans are mandated to adhere to a variety of new regulations aimed at expanding access to coverage. In March 2010 the ACA required all individual and group health plans to allow children or dependents to remain on their parent's health insurance plan until they reach age 26. Children up to age 19 with pre-existing conditions would not be able to be excluded from a plan. From June 2010 to January 2014 a temporary national high-risk pool was created to provide coverage for those with pre-existing medical conditions, prior to a universal ban on restricting coverage in 2014. In September 2010 the ACA restricted the practice of rescission, which refers to the practice of canceling medical coverage after the covered individual becomes sick or injured.

In 2014, new individual and group insurance plans are required to accept all applicants. Pre-existing condition exclusions, meaning excluding a policyholder based on a medical condition present prior to insurance enrollment, will be prohibited. Insurers are required to renew policies as requested. Individual and small group plans are prohibited from basing premiums on an enrollee's health status. Individual and small group plans are able to vary premiums based on an enrollee's age, geographic location, and tobacco use up to certain limits. Annual dollar limits on coverage are eliminated, and coverage waiting periods are limited to 90 days.

Limits on open enrollment in the ACA are aimed at preventing healthy people from postponing obtaining health insurance until they became ill, which could lead to a smaller, more ill population of insured individuals and could cause premium costs to consumers to increase. Insurers are required to spend 80%–85% of dollars on health-care costs rather than administrative costs and profits. Insurance companies are required to issue refunds if this requirement is not met.

Beginning January 2014 the ACA provides funding for states to expand Medicaid coverage to all persons with incomes up to 133% of the federal poverty level. This covers individuals or a family of four with an income of up to $15,521 or $31,721, respectively, in 2014. The federal government will reimburse states for 100% of additional expansion costs from 2014–2016, with a gradual decrease in reimbursement to 90% by 2020 and beyond.

Through the ACA, funding is increased to various grants, scholarships, and loan repayment programs, and increased loan repayment tax relief is aimed at increasing the number of primary care physicians and other needed health professionals (Patient Protection and Affordable Care Act 2010).

LEGAL CHALLENGES TO THE PATIENT PROTECTION AND AFFORDABLE CARE ACT

In the *National Federation of Independent Business v. Sebelius* (2012), the Supreme Court decided on the constitutionality of the individual mandate and Medicaid expansion contained in the ACA.

As background, in 2011 Florida challenged the constitutionality of the ACA by bringing a lawsuit against the U.S. Department of Health and Human Services. As a plaintiff, Florida was joined by 26 other states as well as the National Federation of Independent Business and two individuals. The plaintiffs argued that the Medicaid expansions were coercive, the individual mandate exceeded Congress' powers as defined under the Commerce Clause, and the employer mandate interfered with state sovereignty. The U.S. District Court ruled that the individual mandate provision exceeded Congress' enumerated powers and was not removable from the ACA, invalidating the entirety of the law. They upheld the Medicaid expansion and dismissed the states' challenge to the employer mandate.

In an appeal to the 11th Circuit Court of Appeals, a three-judge panel reversed 2:1 in part the District Court's holding, finding that the individual mandate could be separated from the ACA, leaving the rest of the law intact. Several other federal court cases in 2010 and 2011 upheld the individual mandate as constitutional and, although not directly reviewed by the Supreme Court, represented a countrywide divide (*Thomas More Law Center v. Obama* 2012).

In November 2011, the Supreme Court granted *certiorari* to portions of three cross appeals to the Eleventh Circuit's opinion, with the decision commonly known by the name of one of the cases, *National Federation of Independent Business v. Sebelius*. On June 28, 2012, in an opinion by Chief Justice Roberts, the Supreme Court upheld the individual mandate of the ACA in a 5:4 vote as the imposition of a tax, hence a constitutional exercise of Congress' powers. He explained that Congress' choice of language, stating that individuals "shall" obtain insurance or pay a "penalty" to the Internal Revenue Service can be read as imposing a tax on those who go without insurance. The individual mandate could not be justified as a part of Congress' power under the Commerce Clause (power to regulate commerce among states) and the Necessary and Proper Clause (power to create laws for executing foregoing powers). Justice Roberts argued that the federal government is only able to regulate commercial activity through the Commerce Clause, while instead the individual mandate penalizes economic inactivity. He said that the distinction between doing something and doing nothing would not have been lost on the framers of the Constitution.

In regard to the expansion of Medicaid, the majority of the court found the expansion in some form unconstitutional. Seven justices agreed that Congress had exceeded their constitutional authority by threatening states with removal of Medicaid funding if they did not participate with the expansion. The court said that the ACA's requirement was unduly coercive and narrowed the Medicaid penalty provision by ruling that the federal government could not withhold funding if a state chose not to participate with the expansion in the ACA, essentially removing an "all or nothing choice" and allowing states to choose between participating in Medicaid expansion while receiving additional funding or rejecting Medicaid expansion and retaining existing payments (*National Federation of Independent Business v. Sebelius* 2012).

In time, *National Federation of Independent Business v. Sebelius* could be seen as a landmark decision in federalism jurisprudence (Weissmann 2012). The court's ruling against removal of Medicaid funding if a state did not participate with expansion set new limits on the federal regulation of commerce and on money that the government gives the states. Some experts argued that the Supreme Court ruling could change the relationship between the federal government and states, and could be a worrisome development as many programs are built on the government's spending power (Katyal 2012). Many long-standing laws contain clauses that condition money based on the states meeting certain expectations, making these laws possibly unconstitutional. Several important civil rights statutes condition receiving federal funds for programs based on abiding by nondiscrimination principles and could now be seen as unduly coercive (Russell 2012).

IMPLICATIONS OF THE PATIENT PROTECTION AND AFFORDABLE CARE ACT

In 2012 the Congressional Budget Office estimated that the ACA would reduce federal deficits by $84 billion in its first 10 years when the Supreme Court ruling was taken into account. Savings were estimated to be the result of reductions in spending for Medicare, Medicaid, and through additional tax revenues. Estimates of cost have varied with the American Action Forum suggesting that the deficit would actually increase by $554 billion in the first ten years and $1.4 billion in the succeeding 10 years (Holtz-Eakin and Ramlet 2010, 1136). Debates of cost have been highly politicized and part of the national conversation about the ACA.

Concerns remain that the ACA could actually create incentives for employers to drop insurance coverage. The American Action Forum estimated that in 2010 about 163 million workers and their family receive health insurance through their employers. With the ACA and resulting subsidies, there now exists an alternative subsidized source of insurance for workers that can be accessed if employers do not offer coverage. A simple calculation for businesses focuses on the trade-off between company savings for not providing insurance and the $2000 penalty per employee imposed by the ACA. In 2010 large companies were at least considering the trade-off. However, the calculation is more complex as reducing health insurance benefits may decrease employee satisfaction, making valuable labor more difficult to attract. But with new government subsidies, offering health insurance may not be as important for employee happiness as it was in the past. The American Action Forum estimated that it could make financial sense for employers to drop insurance for 43 million workers (Holtz-Eakin and Smith 2010). However, most micro simulation models for the Congressional Budget office, the RAND Corporation, and the Lewin Group estimate a range of 1.8% decrease to a 2.9% increase in Americans covered by employer-sponsored health insurance (Buchmueller et al. 2013, 1526). In one 2012 survey of employers, 9% of large firms currently offering insurance said that they anticipated dropping coverage in the next 3 years (Keckley et al. 2012). In another 2013 survey, 98% of firms with more than 1000 employees said that they expected health benefits to be an important component of compensation in 3 to 5 years (Towers Watson and National Business Group on Health 2013).

One of the major goals of the ACA and universal health care was to extend coverage to those previously uninsured. By the end of the first open enrollment period in March 2014, more than 7.1 million individuals had signed up for private plans with more than 3.5 million newly insured

under Medicaid, meeting the Obama administration's goals (Shear and Pear 2014). However, it was unclear how many of these individuals were previously uninsured and 10%–15% had not paid their premiums. The Congressional Budget Office estimates that enrollment in exchanges will increase to 22 million in 2016. Coverage varies widely throughout the states with some states having a flourishing of health-care plans and competition while other states have hardly any choices at all. Roughly three dozen states have decided not to establish their own exchanges, relying instead on the federal exchange through HealthCare.gov.

Certain states with opposition have enacted strong restrictions on who can serve as counselors to guide consumers through the enrollment process. Negative press has also been thought to be discouraging consumers from enrolling in plans. At the beginning of the first open enrollment period in October 2013, there was a well-publicized shutdown of the federal health-care exchange website when healthcare.gov received 4.7 million visitors in the first 24 hours. The website failure raised concern from the public about how prepared the government was to implement the ACA. Outreach was variable by states. Some states such as Rhode Island and Colorado created pop-up stores to increase awareness in areas with lack of enrollment. This led to large discrepancies in health-care enrollment between states. In March 2014, an analysis from health economists at the University of Pennsylvania found that in Vermont 54% of eligible individuals had signed up for private insurance, while in South Dakota only 6% had done so (Polsky et al. 2014). In general states that have their own exchanges have reached more of the eligible population than those that have used the federal exchange.

As of 2014, about 25% of those enrolled in health-care plans are between the ages of 18 and 34. This is in contrast to the estimated 40% of total potential enrollees who are in that age group. Experts have argued that an increased number of young enrollees would be ideal to keep premiums down, as young people would have less illness and would help pay for the cost of insuring older, sicker individuals. It is unclear whether or not enough young people have enrolled (Andrews et al. 2014).

As a result of *National Federation of Independent Business v. Sebelius*, many states have opted out of Medicaid expansion. By 2014, 27 states and the District of Columbia had decided to expand Medicaid and receive additional funding from the federal government (Pear 2014). As a result an estimated 4.8 million low-income American fall into what experts call "the gap," where individuals earn too much to qualify for traditional Medicaid but are under the 138% of the FPL needed to qualify for tax credits as part of the ACA.

Public perception and awareness have remained a challenge. By the end of the first open enrollment period in March 2014, the majority of the public unfavorably viewed the ACA, and a significant percentage of the uninsured were unaware of key provisions of the ACA. In a March 2013 poll from the Kaiser Family Foundation, half of uninsured individuals planned to remain uninsured. Half of the uninsured were unaware that the ACA gives states the options of expanding their Medicaid programs, and 4 out of 10 did not know that government subsidies were available to help low- to moderate-income individuals purchase insurance. Approximately 46% of the public viewed the ACA unfavorably with 38% having a favorable view (Hamel et al. 2014).

SUMMARY KEY POINTS

Passed in 2010, the Patient Protection and Affordable Care Act is a monumental piece of legislation that aims at providing universal health care and reducing the number of uninsured through individual and employer mandates, Medicaid expansion, and competitive insurance exchanges. With the majority of the law taking effect starting in 2014, the full ramifications of the ACA have yet to be seen.

- The United States is one of the few industrialized countries without universal health care, and spends nearly twice as much per capita, with little to no benefit in life expectancy.
- Nearly 46 million Americans were estimated to be uninsured in 2007.
- Key provisions of ACA include an individual mandate, where individuals are required to purchase qualifying health insurance, in addition to an employer mandate for sizable companies to provide insurance to their employees.
- The ACA provides funding for states to expand Medicaid to all persons with incomes up to 133% of the poverty level.
- In 2012 the Supreme Court upheld most provisions of the ACA. They ruled against compulsory Medicaid expansion, finding the federal government's withholding of funding to states choosing not to participate in the expansion "unduly coercive."

Social media and the Internet

CATHLEEN A. CERNY, DELANEY SMITH, AND SUSAN HATTERS-FRIEDMAN

The Internet could be a very positive step towards education, organization, and participation in a meaningful society.

Noam Chomsky

It's been my policy to view the Internet not as an "information highway," but as an electronic asylum filled with babbling loonies.

Mike Royko

INTRODUCTION

For many people, the Internet is indispensible and inescapable. It has infiltrated every aspect of our lives. One can pay bills, shop, find a romantic partner, take college courses for credit, research medical conditions, watch television, and share every moment of life online. Through the Internet, one can learn how to do anything from ride a bike to build a bomb. Plus, social media allows someone to become anyone he or she wants to be without the pesky constraints of reality. It only makes sense that the Internet has become an indispensible tool for forensic psychiatrists.

Globally, there are 2.5 billion people online, which is about one-third of the world's population (We Are Social 2014). Four-fifths (81%) of North Americans are online and more than half (56%) are using social networks. Facebook is the largest online social networking site, with over a billion users worldwide. About 48% of all registered Facebook users log in on any given day (Statistic Brain 2014). Google, a web search engine and much more, does over a billion searches daily, 15% of which are novel (Chung 2013). Mobile devices like iPhones and web-enabled tablets allow people to be online anytime, anywhere. As of 2012, 116 million Americans owned smartphones, and in 2014 mobile use is predicted to overtake desktop Internet use (Warden 2013).

The practice of psychiatry, like the practice of all medical specialties, has been altered in a myriad of ways by the Internet and social media. This chapter specifically examines how the practice of forensic psychiatry has been impacted by the Internet. It discusses the importance of the Internet when it comes to doing thorough evaluations. The chapter further comments on how the Internet can be used in forensic psychiatry research and teaching, as well as to promote both individual forensic experts and the field. Importantly, the chapter looks at how the Internet can influence public perception of forensic psychiatry. Finally, the chapter will conclude by looking at Internet-related sources of liability.

THE INTERNET AND FORENSIC EVALUATIONS

Recupero wrote "to a psychiatrist conducting a forensic evaluation, the evaluee's Internet use can be relevant in nearly all aspects of the analysis" (Recupero 2010a, 15). In this day and age when Americans spend an average of 16 minutes out of every hour on social networks (Gaudin 2013), an evaluee's digital footprint can give important insights into their lives. Some potential online sources of digital collateral evidence include personal websites, social networking pages, profiles or tweets, web browser search histories, personal blogs, video sharing sites like YouTube, chat rooms, and other web discussion groups.

What is the benefit of knowing an evaluee's Internet habits and presence? First, forensic evaluators have always used collateral information to supplement, corroborate, or even refute evaluee self-reports. Evaluees can consciously or unconsciously shape the information they disclose during an evaluation to present themselves as they want to be seen. Digital evidence, similar to evidence provided by friends and family, can result in revelations about the evaluee that are not subject to the same type of conscious or unconscious self-editing that takes place in a one-on-one

interview. To be clear, digital evidence dating from a point in time prior to the situation triggering the evaluation may give unguarded glimpses of evaluees; however, online representations can also be edited versions of the evaluees' true selves. Second, gathering information about an individual's web presence may uncover problematic Internet use (PIU). Examples of PIU include pathological gambling, excessive use of pornography, child pornography, self-injury chat sites, and excessive online gaming. PIU can be damaging to relationships and responsibilities. Some PIU, for example cyberbullying, can result in criminal charges. Child pornography is illegal PIU. Third, the evaluee's Internet activities may include explicit threats of harm to self or others. Fourth, a person's web history may show associations with or interests in dangerous fringe groups. Finally, looking at an individual's "digital footprint" can show a forensic evaluator how the evaluee views himself or herself. These areas are discussed in more detail below.

As indicated above, collateral information has long been used to addend, confirm, and/or counter an evaluee's self-report. In the past, psychiatrists had to rely on information from family, friends, police reports, school reports, and other first-hand observers. Now, with the Internet and social media, one can obtain collateral data generated directly by the evaluee. The data are "pure" in the sense that the data were generated at a time when the individual did not know he or she would be forensically evaluated. Search histories and Internet activity may be obtained through attorneys and police cyber experts.

There are many forms of problematic Internet use to explore with evaluees. Recupero offers some excellent opening questions that might help uncover PIU in evaluees (Recupero 2010b). Cyberbullying is one type of PIU, defined as the use of information technology to harm or harass other people in a deliberate, repeated, and hostile manner (U.S. Department of Health and Human Services 2014). Cyberbullying has gotten a lot of attention in the media due to bullying-related teen suicides around the world. Examples include Megan Meier who hung herself after a boy she "met" on MySpace told her that "the world would be a better place without you." It was later discovered that the boy was the online creation of Lori Drew, mother of one of Megan's former friends. The Cyberbullying Research Center has been collecting data from middle and high school students since 2002. In their most recent nine studies, about 26% of the students said that they have been the victims of cyberbullying at some point in their lifetimes. On average, about 16% of the students admitted to cyberbullying others at some point in their lifetimes (Patchin 2015). They also found a lifetime cyberbullying offending rate of 16%. Although most people think of cyberbullying as an adolescent and teen phenomenon, it is not limited to young people; Cyberstalking is the more commonly used term when adults are harassed via technology. Moving beyond cyber-harassment, PIU has sometimes been referred to as "Internet Addiction Disorder" to describe individuals whose activities of daily life are negatively impacted by excessive time spent in online gaming, gambling, pornography, chatting, blogging, pinning, shopping, etc. Although Internet Addiction Disorder is not included in the *Diagnostic and Statistical Manual of Mental Disorders*, 5th edition (*DSM-5*), researchers have attempted to define diagnostic criteria with mixed success. Screening scales such as the "Problematic and Risky Internet Use Screening Scale (PRIUSS)" for adolescents and young adults (Jelenchick et al. 2014) have been developed and can help identify key areas for further exploration. At least one inpatient unit treats PIU.

Examining the Internet activities of evaluees can also give insight into their belief systems and behaviors. Where the evaluee searches, shops, posts, and chats can tell the examiner a great deal that the evaluee may not choose to reveal himself or herself. The Internet search history of an evaluee needs to be put into context (see cautions when using the Internet as collateral below) but can be a goldmine of information. Did the evaluee do research on mental health diagnoses and symptoms prior to the evaluation? Did the evaluee look up information on a topic with negative implications such as bomb building or chloroform poisoning? Online shopping can also be telling. Does the evaluee purchase mind-altering medications/drugs via the Internet? If yes, are the purchases made legally or through legal loopholes? Did they purchase materials online that would help them learn about or engage in dangerous activities? Regarding social networking, is the evaluee part of any online groups that could be considered negative or extremist? For example, there are chat rooms for self-mutilators and anorexia suggestion sites. Has he or she posted or blogged about self-harm or violence against others? It is well known now that Eric Harris, one of the Columbine High School shooters, posted the results of explosive experiments on his websites prior to the massacre. Harris is not the only school shooter to have posted online clues about tragic future plans. In recent school shootings and mass murders, there are additional examples of Internet activity prior to the actual events. (Semenov et al. 2010). There are chat rooms and blogs for any interest under the sun, no matter how dark or deadly.

In addition, data from the Internet can tell us how an evaluee views himself or herself. The content, implied tone, and word choice of a person's post may convey grandiosity, self-importance, or righteous indignation. Conversely, one may learn that an evaluee has a very low opinion of himself or herself.

There are a few cautions when using the Internet as a collateral resource. Context is important when analyzing a person's search history. Was the person looking up information on Neo-Nazis for a research paper or because he or she is interested in that ideology? An evaluee might look up mental health information in order to malinger convincingly during an evaluation. Alternately, the evaluee may simply want to use correct terminology for real symptoms when talking to an intimidating evaluator. Evaluators need to consider generational differences in Internet use and communication styles when examining digital data. The forensic evaluator also needs to understand that an individual's

Table 84.1 Follow-up questions related to online child pornography

- Describe the security you use to protect your computer.
- Do you look at material daily? How many hours a day?
- What is your password for _____ and what does it mean to you?
- Where do you keep your computer? How many other people have access to it?
- Do you back-up/save the material you view online? How? Where do you store the back-ups? How many back-ups do you have?
- Do you have scrubbing software on your computer?
- What do the photos/videos you view have in common?
- Describe the type of material you like to view.

Internet use patterns can change over time for a wide variety of reasons. As indicated above, people can be whomever they want to be online. A person's digital footprint might be revelatory as to how he or she sees himself or herself and how the person interacts with others; however, some peoples' online personas are completely manufactured. There is a spectrum of how accurately someone's online persona reflects reality and also variation in how consciously individuals distort their Internet identities. Interestingly, there are about 81,000,000 fake Facebook profiles (Statistic Brain 2014). As with traditional forms of evidence, digital evidence needs context to be understood correctly.

The biggest obstacle a forensic evaluator faces when investigating the Internet habits of an evaluee may be knowing what to ask about, how to ask about it, and how to interpret the information gathered. Although Recupero has excellent suggestions for opening interview questions (Recupero 2010b), they are the tip of the iceberg. The Internet has its own language, with each site adding new terminology. No single forensic evaluator could possibly know all the ins and outs of every social media site, chat room, news feed, and blog he or she uncovers in the course of an evaluation. Due to lack of familiarity, there is the potential for misinterpretation errors. Evaluators may also not know when they have uncovered something important, and they may lack the language for follow-up questions. Using online child pornography as an example, Table 84.1 provides some follow-up questions when the evaluator thinks he or she has uncovered possible PIU.

THE INTERNET AND FORENSIC PSYCHIATRY RESEARCH

Google scholar (available at http://www.scholar.google.com) and PubMed (available at http://www.ncbi.nlm.nih.gov/pubmed) are online search engines that allow searches for medical and legal terms, and link directly to some free articles. The Journal of the American Academy of Psychiatry and the Law is currently available online free of charge (http://www.jaapl.org) and has a searchable engine in order to access desired articles. Other journals are available at a cost online. Alternatively, sometimes authors of sought-after articles may be contacted directly through email in order to obtain reprints. A frequent benefit of a university teaching appointment is access to their library and resource librarians to aid in locating difficult to find articles. Colleagues can share resources, collect research survey data in particular (through SurveyMonkey), and create Facebook pages to share psychiatric information with the public.

Physicians have a duty to keep themselves up-to-date with medical literature and to ensure that they are practicing medicine based on modern standards (Smith et al. 2011). As new technologies evolve, the standard of care and expectations regarding knowledge about the now much easier-to-access medical literature may also evolve. It is possible, for example, that with the decreasing cost of computers and their easy accessibility, courts could view literature searches as appropriate professional custom, and find liability for those who do not engage in them (Smith et al. 2011).

This may happen whether forensic psychiatrists want it to or not, recalling the famous *TJ Hooper* tugboat case in 1932. Although most tugboats did not have radios at that point in time, having a radio on-board could have prevented a bad outcome in that case. The court found that professions may be held to a standard in which they must use available technologies to increase safety. This was whether or not the technology had been adopted by the field. Similarly, and more recently, in 1974, *Helling v. Carey* (Washington Supreme Court) found that an ophthalmologist was negligent for his failure to diagnose glaucoma when the test was cheaply available and safe. It did not matter that the testing was not standard of care because the patient suing was under age 40 and had a calculated risk of 1 in 25 thousand of having glaucoma. Following the same logic, it might be argued that electronic technologies are cheaply available and safe.

However, it is not only doctors using the Internet looking for medical information. One should be aware that patients may also be searching and making their own diagnoses, as may evaluees in order to make their self-report appear more realistic in malingering. Lists of symptoms of many common mental illnesses are widely available on the Internet, as are actual psychological tests. Even those tests that are used specifically to uncover malingering, the Test of Memory Malingering, the Victoria Symptoms Validity Test, and the Word Memory Test, all had some amount of information about them available on the Internet (Bauer and McCaffrey 2006).

THE INTERNET AND FORENSIC PSYCHIATRY EDUCATION

Modern students are digitally fluent, making the Internet a powerful tool for forensic psychiatry education. The possibilities are almost endless. The Internet allows for education innovations like "flipped classrooms" where students learn the material through online lectures and modules, reserving the precious classroom time for higher-level discussion,

Table 84.2 17 U.S.C. section 107, for factors to be considered in determining fair use

- The purpose and character of the use, including whether such use is of commercial nature or is for nonprofit educational purposes
- The nature of the copyrighted work
- The amount and substantiality of the portion used in relation to the copyrighted work as a whole
- The effect of the use upon the potential market for, or value of, the copyrighted work

Source: Adapted from U.S. Copyright Office. 2012. *Fair Use*. http://www.copyright.gov/fls/fl102.html, accessed June 28, 2016.

integration, and application of concepts. Lectures and presentations on forensic psychiatry topics can be recorded and put online to be viewed by residents, fellows, and colleagues. Instructional videos can be made to educate the general public on controversial and poorly understood topics, such as the Insanity Defense and guns in the mentally ill. Online journals and blogs can be informative and geared toward different audience types.

Many people have given up their televisions in favor of watching on-demand content via the Internet. Entire television series and thousands of movies are available online through services like Netflix and Amazon Instant Video. In addition, YouTube and the like offer up clipped scenes from popular fiction that are easy to access and can be utilized in teaching. Small clips of movies or television shows are permissible to use in teaching within the confines of the Fair Use Doctrine. Table 84.2 shows the four factors to be considered in determining whether or not a particular use is fair per section 107 of title 17, U.S.C. (U.S. Copyright Office 2012). Popular culture examples are useful forensic teaching tools because they grab attention, focus interest, stimulate creativity, and foster connections between students and teachers (Berk 2009). For example, Friedman and colleagues (2011, 2013) created a typology of forensic psychiatrists in fiction. They used the typology as a launching off point to teach about public perception of forensic experts, as well as biases in forensic work. Similarly, Cerny et al. (2014) used fictional women from television to teach about female psychopathy.

THE INTERNET AS A MEANS OF SELF-PROMOTION, ADVERTISING, NETWORKING

Websites exist for many medical and psychiatric practices. Websites may advertise a physician's areas of expertise, provide presentations and publications, and link to one's CV. They may even provide links to media appearances. However, they are not without risk. One important risk is that of impeachment during testimony, especially for example if exaggerations exist on the website (Recupero 2010b).

Recupero described the types of website based on the level of interaction with the consumer. Passive websites contain contact information and descriptions of services—consumers do not interact with these websites. This is considered similar to giving someone a business card or information about a practice. In distinction, business websites are interactive and allow establishment of a relationship—for example, by allowing business transactions or clinical question submission. Intermediate websites do not allow financial transactions but are more interactive—providing advice. The greater the possible interaction with consumers, the greater is the potential legal risk. For example, inadvertently, a doctor–patient relationship and duty may begin. Liability may also ensue from posting inappropriate guarantees on one's website, and breach of contract lawsuits have occurred in other specialties. One should discuss with one's malpractice carrier or attorney regarding website establishment, and consider licensing issues (Recupero 2006).

Similarly, emailing patients is more momentous than it may seem due to the potential expanding legal duty that arises. It is important to adhere to institutional policies when engaging in electronic patient contact. Like with computers and other electronic devices, it is important to have sufficiently strong passwords for email accounts, to avoid unauthorized access to the data contained in sent emails, or other unscrupulous use of an account. More of concern for the forensic expert is email exchanges with legal counsel. This is discussed further in the liability section below.

Medical blogs represent a new opportunity to educate the public about our field. But they also risk revealing confidential information. One needs to consider carefully the appropriateness of pictures and postings on Facebook, lest they fall into hands other than what was expected. Thinking before blogging is critical in order to maintain one's professional image, as well as our profession's collective image to the public. A recent study examined medical blogs (Lagu et al. 2008) from 2006. In that year, 271 medical blogs were found. Patients were individually described in 42% of the blogs, and were portrayed positively in 16% and negatively in 18%. When the researchers further examined blogs regarding interactions with specific patients, 17% included enough information for patients to be able to identify either themselves or their physician. This can raise serious doubts in the minds of the public regarding whether doctors keep their information private. As well, clinical judgment may be of concern (Appelbaum and Kopelman 2014). A famous legal example is that of Dr. Robert Lindeman, a pediatrician involved in a malpractice case, who blogged (under the name of "flea") about the legal strategy and other case participants. Dr. Lindeman was discredited in court for his blog and the case was settled the next day (Saltzman 2007).

THE INTERNET AND PUBLIC PERCEPTION OF FORENSIC PSYCHIATRY

Online content is easily re-watched and shared with others. Forensic mental health professionals need to be mindful about how depictions of mental illness and mental

health professionals, real or fictional, shape public perceptions. As discussed above in the The Internet and Forensic Psychiatry Education section, popular culture is rife with examples of forensic psychiatry. The Internet and social media allow for all those examples to be shared widely and rapidly.

The suicide of beloved actor Robin Williams (August 11, 2014) is an unfortunate example of how quickly information (and misinformation) can spread across the Internet and social media. In the days and hours following Williams' death, there were endless Facebook tributes, celebrity tweets of remembrance, YouTube videos of his famous friends expressing their grief, and up-to-the-minute news posts. About a week after Williams' death, his Facebook page indicated that 7.3 million people were talking about "it." The page had 9.2 million likes, which was an increase of 75% from the week before, with 3.9 million new page likes. In addition to Internet traffic related to honoring and remember this comedic great, there were also many posts regarding treatment for mental illness and suicide prevention. There were efforts to increase awareness about stigma of mental illness and addiction. On the reverse side of things, not all information posted about suicide and treatment has been accurate. Some commentators have compounded the stigma of mental illness and suicide. Internet trolls (seeking to sow discord by starting arguments) reportedly drove Williams' daughter to delete her Twitter account and resign from Instagram. The Internet and social media response to Robin William's suicide shows the power the cyber-world has to shape perception of psychiatry.

THE INTERNET AND LIABILITY FOR FORENSIC PSYCHIATRISTS

While the Internet has created many advantages for forensic psychiatrists, it has also resulted in potential liability. In addition to the concerns for treating psychiatrists described above, use of email can have specific implications for forensic psychiatrists with relation to their interactions with attorneys on cases. In the digital age traditional client-privilege has become more convoluted, with an increasing emphasis on the intent and purpose of communication (*Baklid-Kunz v. Halifax Hospital Medical Center* 2012). Evaluators must use the utmost caution in what is communicated to counsel electronically. Specific areas of concern are appearing overly friendly with an attorney, comments that might be interpreted to convey a bias toward a side and undermine a jury's view of the evaluator as impartial, and appearing to defer opinions to the attorney. A good rule of thumb before sending an email is to read it aloud as an opposing attorney might do and think of potential negative ways it could be misinterpreted.

Evaluators should also be mindful of the volumes of metadata that are now produced as they complete forensic reports electronically. Metadata is the footprint of information generated as one uses technology. In days past, a report may have been dictated using a dictation service or administrative assistant, in which case the only data produced besides the final report may have been handwritten notes and perhaps an edited draft. Today many choose to type their own report manually or with the aid of a voice-to-type software program. Most word processing programs cache changes made in a document over time which can create numerous iterations of a single report that can be accessed electronically, which make up the metadata. This information could be used in court proceedings (Favro 2007). One way metadata about a document can become apparent to others is when a document is sent electronically. This can, at times, allow the recipient to go back through some of the historic versions of the report and see possible changes in opinions or errors that were later corrected (Hricik and Scott 2008). One potential way to address this issue is to transfer documents to a pdf format before sending, though even this is not without potential problems. Similarly, one can use a commercial software "scrubber" or, in the case of Microsoft Office, a document inspector to reduce metadata (Wallace 2008).

Forensic psychiatrists should also be wary of overreliance on Internet-based literature reviews, electronic medical decision supports, or medication information tools as an ultimate arbiter of standard of care. Many of these sites and applications ("apps") specifically state that they are not intended to replace clinical judgment. Similarly, it is the forensic psychiatrist's own knowledge of standards that should be the basis of opinions in malpractice cases and not those of a certain website or app. Just as an expert would hesitate to name a single source text as definitive on a subject, experts should not put themselves in a position of explaining why one website was chosen over another.

SUMMARY KEY POINTS

- Examination of an evaluee's Internet and social media use can be an important part of the evaluation.
- There are pros and cons to digital collateral evidence; context is key.
- The Internet is a powerful forensic psychiatry research tool.
- The Internet and social media can be used to creatively teach "digital natives" about forensic psychiatry.
- Forensic psychiatrists can use the Internet to network and advertise, as long as they keep certain cautions in mind.
- The Internet and social media websites have tremendous influence over public perception of mental illness, mental health professionals, and forensic psychiatry.
- The Internet opens up a whole new world of potential liability for mental health professionals and forensic experts.

Working in private forensic practice

WILLIAM H. REID

INTRODUCTION

This chapter describes one approach to private forensic psychiatry or psychology practice. It assumes that the reader will be retained most of the time by an attorney in a contested ("adversarial") proceeding, though experts are sometimes retained directly by courts or agencies. Many, but not all, of the principles and procedures herein also apply to clinicians who perform forensic services through agency or facility contracts, and/or as employees of agencies or facilities. Readers in academic or agency environments may notice differences between the professional viewpoints implied here and those in their own settings; this should not be construed as suggesting any significant differences in duty or ethics.

Much of the material herein has been summarized or excerpted from the author's book *Developing a Forensic Practice: Operations and Ethics for Experts* (Reid 2013).

The material in this chapter is built on four postulates that underlie successful and rewarding forensic work:

1. Practice well.
2. Understand the point of the legal exercise.
3. Be serious about ethics.
4. Quality begets success.

Courts and lawyers need experts with clinical expertise and some understanding of the legal process, not doctors who act like attorneys. The forensic expert's task is to understand his or her clinical discipline and how it applies to the forensic topic at hand.

PRIVATE FORENSIC PRACTICE

Private forensic practice, as addressed in this chapter, is work (1) at the interface of mental health and the law that is (2) performed in a private, fee-for-service context, usually (3) at the behest of a retaining attorney (but sometimes another entity). It often includes being a forensic "expert" (e.g., an "expert witness," which simply implies being allowed by a court to offer opinions within the bounds of one's education, training, and experience). The kinds of cases in which one may become involved vary, and one should be sure of actual expertise before participating in them (see Table 85.1).

DUTIES

Just as a clinician has certain duties to patients, forensic experts have duties that must be fulfilled in order to meet professional practice standards and, in some cases, legal requirements. For example, the attorney or organization that retains the expert (the "retaining entity") is entitled to know of issues that may affect the expert's ability to do the work, or that may interfere in the future (such as when testifying). Those concerns include conflict of interest, professional problems, inadequate knowledge or experience, and scheduling availability.

There are duties of honesty and objectivity to any court or other judicial or arbitrating body to which opinions are offered. One is expected to articulate opinions well and defend them convincingly, but to be honest in the process.

There are duties to the retaining entity's client(s), including those of practice standards and good faith. One should not, however, advocate directly for the litigant, nor should the litigant or any interested party be one's patient.

There is a duty of honesty and good faith to the opposing side of the case.

Treating clinicians have some duties that forensic experts *do not* have. Experts' duties to evaluees and other litigants or complainants are limited by the fact that forensic consultation rarely creates a "doctor–patient" relationship. Evaluations done solely for a forensic or administrative purpose do not, in my opinion, incur the duties of a treating clinician or clinical consultant. It is a good idea to remind evaluees of that fact, and refrain from calling them "patients" or "clients."

Table 85.1 Some private practice forensic topics

Category (some overlapping)	Includes (but may not be limited to)
Negligence, personal injury	Broad categories of common civil litigation including malpractice, emotional damage, disability, harassment, and discrimination
Criminal	Criminal responsibility (sanity), trial and other criminal-related competencies, offense mitigation
Juvenile adjudication	"Criminal" allegations, juvenile waiver to adult court
Competencies and capacities	Civil or criminal
Guardianships, conservatorships	
Child custody, best interest	
Disability, impairment, fitness for duty	
Workers' compensation	
Consultations, second opinions	A broad category of (usually) nonlitigation topics including helping individuals or organizations with such things as risk management, assessment of dangerousness, and clinical activities involving forensic issues

TRAINING, CREDENTIALS, REPUTATION, AND ETHICS

The expert's usefulness to lawyers, courts, and other entities is almost always related to his or her clinical background. Clinical skill and experience should come first, then forensic expertise.

Approved post-residency forensic fellowships can be valuable preparation for a forensic career but are not necessary for most forensic practice. Forensic subspecialty certification by the American Board of Psychiatry and Neurology is less important than *clinical* certification when working with lawyers and courts.

Accredited continuing education activities on forensic topics can increase one's practice skills. Participating in recognized forensic organizations is a good way to get current professional information, communicate with colleagues, compare practices, and stay abreast of ethical issues and guidelines.

Reputation and credibility are crucial in private forensic practice. They are easy to lose, and very difficult to re-establish. One's clinical background should be free of serious criticism (such as license blemishes, privilege suspensions, ethics complaints, or multiple malpractice lawsuits).

TREATER VERSUS EXPERT WITNESS/ CONSULTANT

The purpose and goals of a treating clinician are fundamentally different from, and often conflict with, those of a forensic expert or consultant. The treater has "fiduciary" and ethical obligations to the patient that demand that the patient's interests be placed above all else. Forensic responsibilities, on the other hand, are largely to objectivity and the court. "Dual" relationships involving both clinical and forensic or administrative work in the same person raise important conflict-of-interest problems, and should be avoided in almost all instances. Acting as both treater and expert without very good reason (such as a genuine emergency) is at best imprudent, and at worst knowingly misleads the judicial process.

The above principles notwithstanding, some "routine" administrative assessments are commonly completed by treating clinicians (though a separate evaluator is often a better choice). In the simplest cases, agencies ask treaters to opine from their records about, for example, mental disability, fitness for duty, or civil commitment.

Things get a bit more complicated when one is asked for a separate assessment or opinion about a patient's condition. Patients and patient care are significantly affected by what clinicians say to others, such as employers or agencies. Patient relationships affect (often strongly and/or adversely) one's evaluations and reports, and vice versa. A separate evaluator is best.

OTHER PRACTICE PRINCIPLES

Advocacy is the lawyer's job, not the expert's. It's not "your case," and the lawyer isn't "your lawyer." With few exceptions (such as the complex area of retention by a *pro se* litigant, not recommended for forensically inexperienced clinicians), *the expert should not be directly retained by a litigant*. Similarly, one should advocate articulately for his or her *opinions* (e.g., in reports or testimony), but not for the litigant per se.

One should not express an opinion without sufficient objective review and/or evaluation, and sufficient and representative information. Any "opinion" attributed to the expert must have an adequate foundation.

One should not communicate directly with a litigant or potential litigant, the court, or an opposing lawyer except through, or with the knowledge of, the retaining attorney. In particular, if someone calls or emails about a personal (or family) forensic matter, the psychiatrist should not do anything that might form or imply a relationship with that

person, such as discussing the potential case or recommending a lawyer.

One should not accept cases without having the requisite expertise and objectivity.

In general, one should not accept an expert role in cases involving friends, close colleagues, etc., for whom there is likely to be significant bias or conflict of interest. It is ethical and proper to offer honest opinions against colleagues; however, one may wish to avoid those in one's own geographic area.

Finally, one must understand the vocabulary of forensic psychiatry. Much of the forensic expert role involves translating clinical information into the language of lawyers and courts, and working in a context of common legal terms. I recommend getting an inexpensive law dictionary.

CASE PROCEDURES

Initial attorney contact

When talking with a lawyer for the first time about a case, one should ascertain possible conflicts of interest early, and discuss them. This includes asking for the litigants' names, to see whether or not any of them creates a conflict. The lawyer's description of the case may or may not be accurate, or entirely accurate. Some lawyers are more straightforward than others. Conversations with attorneys in civil cases are usually "discoverable." One should assume that any notes taken will eventually become available to the other side. No opinions should be formed or offered based on an initial call, and one should not represent that opinions reached later will support the lawyer's side.

One should expect the following from the lawyer or other retaining entity before proceeding:

- An accurate case description, with the name of the case ("styling") if it has been filed
- A clear understanding of the expert's role
- A clear and binding fee agreement
- An expectation of receiving all available relevant records
- Time and freedom to review the records completely
- A general schedule of case deadlines
- An understanding of the expected work procedure

Typical early case procedures

A great many cases should proceed roughly as follows:

1. Receiving an initial communication from a lawyer or other potential retaining entity. Time is spent talking about the matter, getting to know the attorney, answering his or her questions, deciding whether or not one can be useful, deciding whether or not one wishes to participate, and agreeing on retention details. One should take notes and get relevant identifying information. *I do not recommend that this step be completed by email.*
2. Establishing a *written* agreement/contract, including fees and billing procedures.
3. Receiving records. One should request, and expect, *all* available and relevant records, often including clinical, school, employment, legal, corrections, etc., records; others' forensic or clinical reports, and depositions. One should rely on the lawyer to get the records rather than trying to do it oneself. Obtaining records for forensic review requires time and specific legal procedures in order to be certain the records are accurate and complete.
4. Completing an initial review. One may choose to review only selected records at this point but should not offer written opinions without adequate information. Notes should be taken as needed, understanding that they will probably be supplied to the other side (especially in civil matters). One should not be bullied into expressing opinions without all the relevant information.

   Any notes created should be preserved. An expert's notes and other materials are rarely "work product" (a concept that applies to lawyers, rarely to experts). Destroying notes, records, emails, phone messages, etc., created during the case is inappropriate, and can be illegal.

   A somewhat inexperienced plaintiff's expert was being deposed in a particularly sensational case involving several defendants. Lawyers from several firms were in the room as he began to answer questions posed by the other side's lawyers:

   Opposing Lawyer: "Did you receive my *subpoena duces tecum*, doctor, asking you to bring all of your notes to the deposition?"
   Expert Being Deposed: "Yes."
   Lawyer: "And may I see those notes, please?"
   Expert: "They aren't available."
   Lawyer: "Really? May I ask why not?"
   Expert: "I shredded them after I received your subpoena."
   Lawyer (somewhat taken aback): "May I ask why you shredded your notes in this case after being specifically asked to produce them for this deposition?"
   Expert: "They were my private notes, and I thought they might be harmful to (the plaintiffs)."

   The deposing lawyer spent the next several minutes on the record explaining the concept of "spoliation of evidence" (a felony), and sarcastically asking, in front of several lawyers who would likely spread the story to others, why the doctor should not be charged with a crime for destroying his notes.
5. Oral communication with the lawyer or retaining entity about the preliminary review, any need for further records, and next steps (such as examination, report, or testimony). One should not communicate

in writing, or create any report, unless the attorney requests it.

Many cases end here. The great majority never get to trial; many are resolved one way or another before reports are written or expert depositions taken.

6. Examinations, interviews, and/or testing. Examining or interviewing litigants or others should not take place before case review and discussion with the lawyer (there are exceptions).

DISCUSSING FINDINGS WITH THE LAWYER

Regular communication is important. Discussions and updates should cover, in terms the attorney can easily understand, how the review findings may affect the case. One should avoid using lots of psychiatric terms or "psychobabble"; the lawyer wants to know what the expert thinks, wants a clear and concise summary, and wants to see that the expert can convey his or her findings to others (such as jury members) articulately. If the findings seem ambiguous or the expert's views are ambivalent, now is the time to talk them out and try to find clarity. Early discussion focuses one's thoughts, so that future reports or testimony can be as concise as the findings allow.

"Adverse" findings

Lawyers often benefit from expert findings that seem to go "against" their clients almost as much as they benefit from findings that "support" them. They need to know both the strengths and the weaknesses of their cases in order to evaluate case merits objectively, save time and money on frivolous litigation, promote reasonable negotiations and settlements, and help their clients accept the truth about their situations. In addition, if one finds few merits in the psychiatric issues of a case, expressing or (if asked) documenting that result may protect the attorney from later criticism for not pursuing them (e.g., for not pursuing an insanity defense in a criminal matter).

EVALUATIONS

Even "simple" evaluations usually require record review before interview or examination. They should be treated with the same professional routine as any other case. Two exceptions are assessments for acute dangerousness and examination of criminal defendants, which require record review, but examination should take place as soon as feasible.

One must know the clinical principles involved in the evaluation (such as for assessing children, dealing with substance abuse, or exploring clinical nuances such as suicide risk), and apply them in the subspecialty forensic context (addressed below). *Routine clinical procedures and attitudes alone are insufficient for forensic interviews.*

Although psychiatrists and clinical psychologists are accustomed to dealing with sensitive topics, forensic evaluations often involve situations rarely encountered in general clinical practice. The objectivity required in assessments, reports, and testimony suffers when the expert cannot adequately recognize and manage his or her personal feelings about, for example, particular tragedy or heinous behavior. One should decline cases in which he or she cannot remain objective.

What if the evaluee fails to appear or does not cooperate?

OPPOSING ATTORNEY REFUSAL

The opposing attorney may believe an evaluation would jeopardize his or her case, or not wish to expose the litigant to additional scrutiny. He or she may allege that the evaluee would be traumatized by the examination. Opposing lawyers may also try to place unreasonable restrictions on one's evaluation (see below). These are usually matters for the lawyers to work out between themselves. One might comment about (a) the extent to which not doing an evaluation may affect your ability to form opinions, (b) the extent to which not doing an evaluation may affect your credibility, (c) the disclaimer that must be added to any report or opinions that lack an appropriate examination, and (d) the fact that psychiatric evaluations are almost never particularly "traumatic" for evaluees.

EVALUEE REFUSAL

If an evaluee calls to cancel, or does not keep the appointment, one should contact the retaining lawyer (not the opposing one). One should not reschedule or "negotiate" directly with the evaluee unless it is simply a matter of scheduling a more convenient time (and in that case notify the retaining entity). If an evaluee balks after arriving or demands to leave after the interview has begun, one should be polite, encourage the evaluee to stay, and briefly try to address concerns that may be making him or her uncomfortable. One should not "negotiate" extensively or do things that might be construed as manipulation in return for completing the examination. If the evaluee actually ends the interview prematurely, he or she should be politely informed that the behavior will be noted in the evaluation record, and the retaining lawyer informed.

Differences between forensic and "patient" interview styles

- A forensic evaluee almost always has a nonclinical interest in the outcome of the evaluation and the case.
- A forensic evaluee often has good reason to fool or mislead the examiner, and most can do so to some extent. Examiners should not assume that they can tell whether or not the evaluee is telling the truth, or whether or not an answer is accurate.

- Forensic evaluations thus usually require extensive corroboration.
- Forensic evaluators generally have no duty of "patient" confidentiality or clinical care to an evaluee (see Consents and Notifications, below).
- Unless targeted to a specific topic (such as trial competency), forensic evaluations are routinely longer than clinical ones, and frequently more comprehensive (see below).

Examination principles

QUESTIONS FROM THE EVALUEE

The examiner has no obligation to answer every question an examinee asks during or after an interview (and often should not), but queries and concerns should be handled with sensitivity. I recommend against providing feedback to evaluees about the examination. One may simply acknowledge that the question is reasonable and refer the evaluee to his or her attorney or other relevant party.

Evaluees often ask for a copy of the evaluator's report. Although they may be entitled to a copy at some point, it should not come from the examiner, but from the evaluee's attorney or other party (insurance company, employer, etc.), as relevant.

OUTSIDE CONSULTATION

If outside consultation such as psychological testing, general medical examination, laboratory tests, or neuroimaging is necessary for a complete evaluation, one should talk with the retaining attorney before arranging it. That discussion should include whether the additional person will be the expert's consultant or separately hired by the lawyer, and how he or she will be paid.

SCHEDULING AND PROCEDURE

One should give the retaining attorney or agency interview specifications and explain why they are important. Everyone should understand the evaluating expert's role, expected procedures (including pre-examination review and post-examination communications), the kinds of results that may reasonably be expected, the likely number and durations of interviews and/or testing, the examination location and environment, recording procedures, and approximate cost. The court may dictate or limit some of these. One should resist procedures that might prevent a proper and complete workup. Except for simple things like verifying times or giving directions, communications should be through the retaining attorney or agency, not directly with the evaluee.

SETTING

A professional office should be used whenever feasible, either one's own or a colleague's (e.g., when evaluating someone in a distant community). Personal settings such as a home office, hotel room, or the evaluee's home should be avoided, although an evaluee's home may be appropriate for some child or family evaluations, or civil capacity assessments in which the person cannot travel. Assessments should not be performed in lawyers' offices.

JAIL/PRISON SETTINGS

Assessments should be during "contact" visits whenever feasible. The retaining lawyer or agency should arrange the visit in advance, understanding the examiner's requirements and preferences. One alternative is to ask for the kind of room in which lawyers talk with their clients. A face-to-face interview using shackles, even through bars, is better than one through glass, by intercom, or through a detail-obscuring screen.

EXAMINER SAFETY

The following apply to all evaluations and clinical settings:

- The examiner should never knowingly put himself or herself in danger. Inattention to—or overconfidence about—assault by evaluees and patients has gotten evaluators killed.
- Examiners must not believe they can predict, "sense," or "talk down" assaultive behavior in predatory, enraged, frightened, psychotic, or confused evaluees. "Sensing" danger is cause to act on that intuition, but *one must not rely on intuition to prevent assault*.
- One must not let anyone else put him or her in danger, or accept a setting that might be dangerous. If a correctional officer, nurse, or other person assigns a setting that may not be safe, one should demand a safer one, a monitor, and/or a chaperone, as needed. *Examiners must not be shy about this*.
- "Panic buttons" and advice such as "don't sit between the evaluee and the door" are woefully overrated (especially when the door is locked).

WHO MAY BE PRESENT DURING THE ASSESSMENT?

Alone is best, if it can be accomplished safely. Security or corrections staff may monitor through a window but should almost never be within earshot of normal conversation. Sometimes an attendant or chaperone is required. He or she should be unobtrusive, avoid interfering unnecessarily, and afford as much privacy as feasible. A parent or guardian may be necessary or recommended for children's interviews, and sometimes group or family interviews are important; otherwise, family and co-litigants should not be present without good reason.

Having a lawyer in the room compromises the evaluation. The evaluee may be entitled to have his or her attorney there, but one should not accept a lawyer's presence without careful consideration with the retaining person. An audio or video recording of the assessment, particularly with an unattended recorder or camera, may allay an opposing attorney's concerns (see below). If an attorney demands to be present, he or she must be out of the evaluee's vision and be silent. Examiners should not tolerate lawyer interference. If it occurs, it should be carefully documented and consideration given to terminating the assessment.

RECORDING (AUDIO OR VIDEO)

Recording most interviews and evaluations is highly recommended. Video is preferred. Concerns that recording will alter the atmosphere of the interview are unfounded. Properly done, the process is usually innocuous; experienced videographers know how to be unobtrusive (although an unattended camera may be preferred). Recording *should not* be surreptitious. Continuous recording provides accurate, usually unimpeachable, documentation. It decreases some evaluator liability (e.g., for alleged inappropriate behavior). It renders detailed note-taking unnecessary and is helpful when writing reports. Recording may also increase the evaluator's credibility, showing that one is not afraid of scrutiny. It may defuse attorney requests to be present in the interview, and reassure the evaluee that the examiner will be honest and objective.

EXAMINATION FORMAT AND BEHAVIOR

Format and content vary with the purpose of the evaluation and other factors. There is not space in this chapter for a complete discussion, but here are some principles:

- Forensic interviews are not mere extensions of patient interviews. One must know the purpose and context of the evaluation, and modify the format and style accordingly.
- The examination should not be limited by common time constraints of routine clinical assessments. Many forensic evaluations should take several hours, not including psychological testing and other procedures. It is often useful to schedule two or more interviews.
- The procedure should be as professional and friendly as is compatible with the circumstances. One should explain the process and format to the evaluee, and offer breaks as appropriate.
- One should be respectful, but not "sandbagged" by the evaluee. Persistence and follow-up to queries are important. One should watch for both conscious and unconscious evasiveness, and be very thorough.
- The examiner should be honest (just as one expects of the evaluee), and avoid "tricks" such as making a sudden noise to assess startle effect.
- One may consider inviting the evaluee to bring one or two other people to the interview to provide corroboration, expansion, support, and/or contradiction of the evaluee's statements. One should talk separately with them, avoiding opportunity for the parties to "compare notes" between interviews.

CONSENTS AND NOTIFICATIONS

It is rarely necessary to obtain written consent from forensic evaluees, although some professions recommend it. The evaluee has usually agreed, through a lawyer, by virtue of pursuing a claim or action, as part of an employer or agency requirement, and/or in following an attorney's instructions, to be evaluated for the purpose contemplated. In addition, many evaluations are required by a court order (although the evaluee may simply refuse to participate). The evaluee is free to stop the interview at any time.

The above do not mean that one should proceed without regard for the evaluee's feelings and need for information. One should provide simple, clear facts about the following, ideally in written form, with a copy kept for the file:

- The evaluator's name and profession (and those of others in the room)
- The general purpose of the examination
- The evaluator's role in the case and who has retained him or her
- The fact that the evaluation is being recorded (in writing, by video, etc.)
- The uses to which the information obtained may be put (attorney discussions, a report, testimony, etc.)
- The fact that the evaluation is not intended to be stressful and breaks may be taken at any time
- The fact that the interviewer will not ask about the legal strategies of the case except as relevant to the evaluation task
- An invitation to ask reasonable questions
- The need for the evaluee to be honest and frank

This introductory process will often set a tone of comfortable professionalism, with a minimum of adversarial stance.

EVALUEES WITH CLINICAL NEEDS

Absent an emergency, one *should not* treat or give specific clinical advice or referral names to an evaluee. Simple, generic encouragement is often nice (e.g., "I hope you feel better soon"), but if one believes care is necessary, it should be recommended through, or after discussion with, the retaining attorney.

Special note regarding criminal defendants

When criminal responsibility (criminal "sanity," generally the mental ability to form criminal intent) is an issue, it is important to interview the arrestee/defendant as soon as feasible after the alleged crime. Nevertheless, *one must not forensically interview an arrestee before defense counsel is appointed and notified*. It is ethical to evaluate and treat an unrepresented arrestee or defendant for *clinical* purposes, but one must not do any "forensic" evaluation or assume any expert role. If such a person blurts something out, it may be recorded along with an impression of the person's state of mind at the time (e.g., delirious, intoxicated, psychotic, or not). One should not pursue the topic with the person unless it is clinically necessary. An examiner who treats an arrestee/defendant should not become an expert witness in the same case.

REPORTS

Reports are lasting representations of one's opinions, abilities, expertise, and effectiveness. In most cases, they are the expert's most influential activity. Done right, they help the case and the expert's reputation. Done wrong (e.g., without adequate preparation, misunderstanding the purpose or audience, with poor writing skills, or in the wrong format), the case is likely to suffer and one's usefulness to the attorney or court becomes severely limited. Forensic reports are quite different in format and intent from clinical reports, and effective styles vary with cases. Some reports take the form of letters or affidavits. They often become part of a public record.

What do reports and affidavits accomplish?

- They formally convey one's opinions and other information to parties who are important to the case.
- They organize and clarify the expert's opinions.
- They are a tool for resolving cases.
- They often become the basis for later testimony.
- In some situations, they determine whether or not a civil lawsuit (e.g., malpractice suit) can proceed.

Lawyers sometimes ask for a quick, last-minute report. One should resist such requests, because supporting information may be inadequate, and hurried reports are often sloppy or incomplete. One should take the time to follow a standard routine rather than being pressured by the lawyer. *It is improper to allow a lawyer to write one's report or convey opinions that you have not genuinely rendered*. The expert may, however, accept some predetermined format or talk with the attorney about helpful ways to frame opinions once they have been formed.

Report format

Format and style vary with the case, jurisdiction, and expert.

Short is usually better than long, unless the important information is very complex. Long reports are tiresome, and the more voluminous the material, the more likely it will contain extraneous material that may be harmful to the case. Well-written brief reports generally take extra thought and care. Winnowing the important points from many hours of work, then concisely explaining and supporting them, is time consuming.

Reports must be clear for the reader. They should be written for lay readers rather than professional ones, with opinions stated early and easy to find. One should avoid extremely detailed clinical material, extended recitations of psychodynamics, and pseudo-legalistic prose, but remember that expert opinions must be accompanied by sufficient explanation. When there is doubt, one may ask the person who requested the report how much explanation is required.

Some reports require certain kinds of format and content. If such requirements are not followed, the report can be invalidated or the case threatened. The retaining attorney can clarify those needs.

Legal terms must be used correctly. One should know the applicable *legal* definitions of all terms used in reports (e.g., "reasonable medical certainty/probability," "standard of care," "foreseeability"), not simply dictionary definitions or common usage.

Relevant disclaimers and caveats are important

One of the most important caveats is that the report is predicated on the information available at the time it was written, and the writer reserves the right to amend it if additional information becomes available. Another is disclosure of whether or not relevant persons were examined (e.g., criminal defendants or civil plaintiffs), and if they were not examined, whether or not examination might change the opinions in the report.

Reports should be well written

The report is a lasting representation of the expert. It must be properly formatted, clearly organized, and contain excellent grammar and spelling.

TESTIFYING

Most cases do not go to trial, but one must assume that testimony of some kind will be required.

The expert should always have a pre-testimony conference with the retaining attorney

The lawyer should bring one up to date about the case, go over likely questions and what he/she thinks is important, and maybe discuss the opposing lawyer. He or she may give advice such as

- "Listen carefully to the question."
- "Don't answer too quickly. Think first."
- "It's not a memory test. If you need to look at records or notes, do so."
- "Give short, direct answers; don't answer more than you're asked."
- In depositions, "don't be misled by the informal setting."
- "Don't speculate."
- "Don't argue (but *do* correct misunderstandings)." Arguing usually weakens testimony.
- "Don't be flippant, disrespectful, or arrogant." The opposing lawyer already knows the answers to most of the questions you will be asked. Your sense of humor is easily misconstrued, weakening your credibility.

Experts should stick to forensic opinions, not philosophy

Verbose, off-the-cuff explanations usually weaken testimony.

"Just answer 'yes' or 'no', Doctor"

One should generally ignore a demand for "yes or no" if the question cannot reasonably be answered that way (or if the false dichotomy of "yes or no" would misconstrue one's meaning). Experts are entitled to explain their answers, or respond with something like "I don't know"; "I can't answer 'yes-or-no' as you've phrased the question"; "answering 'yes or no' would misconstrue my opinion"; or "I don't understand your question."

Questions should be answered only once

Lawyers sometimes ask the same question several times, and then choose the most advantageous answer. One should not be talked out of accurate answers.

Personal questions

One should politely set limits on irrelevant personal questions (the answers are public record), but whether or not something is relevant is the judge's decision, not the expert's. "How much have you charged in this case?" is fair. "What was your gross income last year?" is probably out of bounds.

Experts must be able to tolerate criticism

Testimony is neither a collegial nor a scientific exercise. It is *adversarial*. Experts must tolerate questioning from lawyers who vigorously oppose their testimony, and who may be very good at turning their words, opinions, and even behaviors to the other side's advantage. When one has solid and well-articulated opinions, the opposing attorney may attack the expert's qualifications. That is unpleasant, but it is not personal; one should not become defensive.

Testimony should generally be free of surprises

Both the expert and the lawyer who retained him or her should know the strengths and weaknesses of the expert's opinions, potential arguments against those opinions, and any controversial issues in the expert's background *before* testimony.

Depositions

It is common for experts in civil matters to be "deposed" by the opposing side, usually after submitting an expert report. Deposition is a questioning process, carried out under oath, designed to reveal one's opinions and what one would say at trial. The setting is relatively informal, perhaps an office (preferably not one's own) or conference room, but the rules are strict.

Once a deposition is scheduled, the expert probably receives a *subpoena duces tecum* from the opposing lawyer (a demand to bring case records, files, notes, billing materials, etc.). One may question, or even decline, some of the requests (e.g., for highly personal items or onerous demands), but that should be done through the retaining lawyer. Many depositions are video-recorded and may be shown to the jury. When this occurs, one must behave (and dress) as if he or she were actually in court, and direct answers to the camera.

Trials

In trial testimony, opinions and comments should be directed to the "factfinder" (usually a jury, but sometimes the judge), not to the lawyer asking the questions. One should speak clearly and simply, uncomplicating the issues if possible, with concise points of importance. Jurors usually like doctors, but they hate arrogance, pseudoprofessional "psychobabble," and being "talked down to."

FEES AND BILLING

Fees, billing, and collection procedures in forensic practice are quite different from those in clinical practice. Most forensic practices have far fewer clients; individual bills are larger, and collections are usually better. Resolving billing disputes is far more straightforward.

Understanding the practicalities and ethics of charging and billing for forensic services greatly simplifies practice management. One should be clear about rates and fees, responsibility for payment, expectation of payment, and schedule and method of payment. Lawyers understand hourly fees, retainers, deposits, and the value of professional time and expertise.

One should realize, but not overestimate, one's value. Forensic professionals usually charge more per hour for forensic services than for clinical ones. Rates vary with training, experience, reputation, location, and personal preference. Most charges should be time based (procedure based may be acceptable). "Contingency fees" (those related to case outcome or lawyer recovery) are unethical.

Requiring a retainer and/or deposit against billings is usual (especially for new clients, time-consuming reports and testimony—see below). As a practical matter, one should watch for early portents of fee and collection problems, and be cautious if the attorney does not agree to a retainer or is late with payment.

In general, the person or entity that retains the expert should receive the bills. The financial agreement should be with the attorney or retaining entity, *not* with a litigant or other lawyer's client, even though that person may be the ultimate source of funds. One should not be expected to bill litigants directly, or to bill an insurance company, unless the company itself is the retaining entity.

It is important to bill regularly, and not let debt get out of hand. *One should never wait to bill until the case has been decided*.

All agreements should be in writing. The attorney should receive a written description of expert fees and billing procedures. Exceptions to standard procedures increase the probability of fee and collection disagreements. The "fee sheet" should specify the person or entity responsible for charges and the services to be charged. Time spent reviewing, interviewing, talking with the attorney and others, preparing reports, and testifying are obvious, but the fee agreement should also address things like unkept appointments, travel, and waiting time.

The fee agreement should note that work may cease if bills are substantially in arrears or deposits are not received. This can include not releasing reports and not being available for deposition or trial. One should be reasonable but firm in these communications, and try to prevent problems by being clear and taking early action rather than letting payment problems build.

OFFICE PROCEDURES

A successful forensic practice does not need a very large administrative system, but it must have a very *good* administrative system. Private practice is a service business that requires an excellent interface with forensic clients and a reliable, efficient "back office."

Staffing

People are the backbone of the practice, even if one has only one assistant. One should employ the very best staff feasible: intelligent, polite, dedicated, efficient, and very good at interacting with others (upon whom one's livelihood depends). Staff should be chosen carefully, trained well, and treated right.

The practice exists for the benefit and convenience of clients

Return business and word-of-mouth referrals are almost always one's largest revenue sources.

Availability

The telephone is one's main interface with clients and potential clients. The person who answers the office telephone *must* be a well-trained, courteous, real person. Potential clients who get a voicemail message very often go somewhere else.

Email and texting do not replace telephone contact

New attorney–clients may first email, but detailed contact should be by phone or in person, not by email or text. One learns far more in a direct conversation, with fewer security concerns.

Practice and its files be kept secure

New staff should have background checks and be trained in basic security procedures. One must be aware of, and deal with, the substantial security risks associated with email. Employees and contract workers should sign a confidentiality agreement.

Records

Everything that enters or leaves the office should be logged, including phone calls, letters, records, deliveries, and visitors. All case-related telephone conversations, scheduling agreements, billing changes, and the like deserve a file memo. There should be a procedure for keeping track of current and past cases, deadlines, case types, past testimony, referral sources, and similar information. These seeming "details" help one analyze practice patterns, keep track of referral sources, and adhere to jurisdiction rules (e.g., federal court rules for supplying testimony information).

Client files and records must be kept secure but easily accessible. Records often must be located after months, even years, of quiescence. It is useful to create a very accessible summary file for each case, with notes, reports, and other frequently addressed information. One *should not* store client records in "the cloud" without the client's permission and a very reliable retrieval and security system. Closed case archives should be kept until the client says they may be destroyed; one may wish to keep personal notes, reports, and financial files for decades.

Billing and collections

Most lawyers pay promptly; a few make it very hard to collect. Most collection problems can be prevented before they arise. A specific billing procedure, understood in writing before providing services, is a big help.

Budgeting

Compensation in private forensic practice usually comes in fairly large amounts, but infrequently. Slack periods and payment delays are routine. Retainers and deposits do not belong to the expert until they have been earned. It is helpful to keep a separate account for retainers and client deposits, to facilitate prompt refunds.

SUMMARY

This chapter has outlined the basic topics and procedures that make up most private forensic consultations: attorney relationships and communication, expert roles, record review, forensic examinations, forensic reports, and testimony. It also addressed many of the practical aspects of forensic work, such as office procedures and differences between general and forensic practice.

SUMMARY KEY POINTS

- Successful forensic work demands a clear understanding of one's duties and ethical responsibilities.
- Contrary to clinical duties, which largely arise from a doctor–patient relationship, much of one's forensic responsibility is related to being honest and objective for others to whom one owes a duty (often a retaining lawyer and/or a court).
- "Hired guns" and "whores of the court," common topics of public and media criticism, have no place in our profession.
- Practitioners who choose to become involved in forensic cases should first be very good clinicians, then understand what the legal process requires of a forensic consultant or expert witness.
- Quality forensic practice recognizes the differences between a purely clinical approach and the additional procedures and objectivity expected by lawyers and courts.

Social science, law, and psychiatry

EUGENE LEE AND ANN M. KILLENBECK

INTRODUCTION

In their pathbreaking work, *Social Science in Law: Cases and Materials*, John Monahan and Laurens Walker argue that the use of the social sciences in the law reflects a departure from the "classical belief that the application of logic could determine a single, correct solution for every [legal] case" to the more nuanced "view that the answer to legal problems varies according to the social context" within which they arise (Monahan and Walker 2014, 1). This approach treats "law as a means of establishing social policy" and stresses the importance of identifying and using information about how people, and society, actually function (Monahan and Walker 2014, 1).

The social sciences—generally understood as those disciplines that study human society and individual relationships in and to society—include, but are not limited to, psychology, sociology, criminology, anthropology, history, economics, and political science. These areas of inquiry focus on many of the same issues that interest psychiatrists, in particular, forensic psychiatrists, albeit from diverse angles. This is entirely understandable. "Forensic" comes from the Latin word, *forensis*, meaning: public; to the forum or public discussion; argumentative, rhetorical, belonging to debate or discussion (American Academy of Forensic Sciences 2015). Forensic psychiatrists accordingly share common concerns with social scientists, and their work may be informed by social science not only in criminal matters and civil disputes, but also in questions of public health and policy.

The social sciences and social science studies—including psychology—differ from the medical education and training of psychiatrists. Nevertheless, it has been suggested that psychiatry may be closer to social science than to physical science (Stone 2008, 170). The diagnosis of mental disorders, for example, factors in psychosocial context (American Psychiatric Association 2013, 16). Psychiatrists may generally be versed with individualized bio-psycho-social modeling of patients' symptoms, functioning, and quality of life (Engel 1977, 132). There is, accordingly, overlap between the clinical disciplines.

Opportunities for meaningful dialogue are especially pronounced with the legal arena. Social science has been accurately described as contributing a "massive amount of material" dealing with psychiatry and law (Malmquist 2004, 1144). Indeed, numerous decisions by the Supreme Court of the United States have incorporated insights gleaned from the social sciences, with profound implications for forensic psychiatrists. Comprehensively summarizing these materials falls outside the scope of this book.

The goal of this chapter is to illustrate how some of these disciplines—and the cases in which they have factored—bear relevance to forensic psychiatry. It begins with a discussion of two overarching considerations. The first is a brief discussion about scientific methodology. The second, an examination of the importance of contexts in the issues implicated. The balance of the chapter then discusses a small set of examples of social science applications pertinent to forensic psychiatry.

METHODOLOGY

Generally speaking, clinical and legal researchers may ask: how does one know what is thought to be known? Randomized, double-blinded, and placebo-controlled interventional studies (for instance, involving biomedical pharmaceuticals) present one form of evidence. Population-based, observational studies may provide similarly rigorous evidence of a different nature. Both approaches (interventional and observational) should invoke critical analysis of association before cause-and-effect might be inferred.

Theorists of causality in the social sciences must consider the argument made by a group described as "Emergentists," who hold "that *some* social phenomena (and indeed, some physical and biological phenomena), rather than *all* of them, are not amenable to scientific investigation insofar as such investigation is causal" (Rudner 1966, 71). They may focus on a "thesis of absolute emergence," a form of skepticism which "advances the belief that some events are, in *principle*, unpredictable (i.e., there are events the prediction of which is *logically impossible*), since they are not connected with other

events in any lawlike fashion" (Rudner 1966, 71). A different variant suggests a "thesis of *relative* emergence," which posits that given "certain circumstances (e.g., our technology or knowledge, or the inaccessibility to observation of phenomena, at a given time), it is not *technically possible* to predict the occurrence of certain events" (Rudner 1966, 71).

Social science in particular might require familiarity with both qualitative and quantitative research methodologies. The former is especially pronounced in social science investigations, which may use qualitative techniques to gather information relevant to understanding human behaviors and factors relevant to such behaviors. In the latter, quantitative approaches require thoughtful distinction between statistical significance, clinical significance, and legal significance (Kraemer and Kupfer 2006, 990; Monahan and Walker 2014, 94). Additionally, even statistically significant results have limited applicability on individual case assessments without, for instance, adequate matching of control variables.

BEHAVIOR AND CONTEXT

Forensic psychiatrists and social scientists may study patterns in peoples' behaviors. For some, this includes questions of culpability and consequence. These are also central elements in the law, a system of rules that protects rights and governs behaviors. When individual behaviors conflict with those rules, prescribed directives are applied in ways that—at least theoretically—maximize consistency and fairness. Criminal law, for example, serves to punish (both as retribution on the criminal, and as restitution for the victim), to deter (incapacitating the criminal, and serving as an example to others from doing the same act), and to express values of society (Wilson and Herrnstein 1985, 492–498). As one great figure in American law wrote:

> What have we better than a blind guess to show that the criminal law in its present form does more good than harm? I do not stop to refer to the effect which it has had in degrading prisoners and in plunging them further into crime, or to the question whether fine and imprisonment do not fall more heavily on a criminal's wife and children than on himself. I have in mind more far-reaching questions. Does punishment deter? Do we deal with criminals on proper principles? (Holmes 1897, 470)

As they answer these questions, legal decision makers routinely incorporate expert clinical assessments of human behavior. Some obvious examples include evaluations for criminal responsibility, competence to stand trial (and restoration of fitness when incompetent), and managing the risks of self-injurious and violent behaviors, topics covered in detail elsewhere in this book. How though, do physicians treat patients suffering from mental disorders characterized by patterns of violating the rights of others?

For example, the diagnostic criteria for Conduct Disorder include "a repetitive and persistent pattern of behavior in which the basic rights of others or major age-appropriate societal norms or rules are violated" (American Psychiatric Association 2013, 469). Similarly, Antisocial Personality Disorder features "a pervasive pattern of disregard for and violation of the rights of others" (American Psychiatric Association 2013, 659). Such behavioral patterns themselves are typically neither exculpatory (e.g., the insanity defense) nor preclusive of treatment, rehabilitation, and recovery.

Understanding behavioral change for justice-involved persons is of natural interest to forensic psychiatrists. Are the causes of crime "buried deep in political economy, culture and social structure," and interventions "mere tinkering" (Andrews et al. 1990, 45)? Challenging reliance on models of psychopathology, one meta-analysis compared effect sizes for major predictors of recidivism, finding no significant difference between mentally disordered and non-disordered offenders (Bonta et al. 1998, 123). Here, criminal history variables were the best predictors for recidivism, and clinical variables had the smallest effect sizes (Bonta et al. 1998, 129–132).

More recently, a 2012 white paper from the American Council of State Governments Justice Center put forth a three-dimensional framework integrating criminogenic risk with behavioral health needs (e.g., substance abuse and mental illness), emphasizing that mental illness is not a core criminogenic risk factor (Osher et al. 2012, 33–34). The paper highlights risk factors predictive of future criminal activity, with numerous factors clearly outlining the justice-involved person's social context. These criminogenic risk factors include one's associates (who are potential sources of positive—and immediate—reinforcement for criminal behavior) and situations involving family and educational, vocational, and leisure-time pursuits (Osher et al. 2012, 23).

Psychiatric de-institutionalization also deserves mention with respect to social context, as the number of patients in American state and county mental hospitals peaked at 559,000 in 1955. This was followed by decades of consistent annual declines (Mechanic and Rochefort 1990, 307). By 2014, the census in state hospitals had dropped to 40,600 people (NASMHPD 2014, 6). De-institutionalization is understood in three separate domains. First, psychiatric medication rose to large-scale use (Brill and Patton 1957, 509). Second, courts examined civil rights for persons potentially living with mental illnesses. (See, e.g., *Baxstrom v. Herold* 1966.) Third, applied economic and political sciences created vehicles enabling hospitals to discharge patients to community settings, using then-novel programs such as Community Mental Health Centers, Medicare, Medicaid, and Social Security. With shrinking availability of psychiatric hospital beds, the potential for flux into jails and prisons (e.g., "trans-institutionalization") is questioned. At times, this debate references a study of European countries finding inverse associations between estimated numbers of psychiatric inpatients and (1) the numbers of

prison inmates, and (2) the numbers of deaths attributed to murder (Penrose 1939, 12).

EVOLVING STANDARDS OF DECENCY

An example of the interplay between and among American law, social science, and forensic psychiatry can be seen in the use and value of the social sciences in cases implicating the Eighth Amendment prohibition of "cruel and unusual punishments." That limitation on government authority is important but, as is often the case with constitutional provisions, susceptible to many meanings. As Chief Justice Warren observed in the seminal case of *Trop v. Dulles*, 356 U.S. 86, 100–101 (1958), "the words of the Amendment are not precise, and … their scope is not static. The Amendment must draw its meaning from the evolving standards of decency that mark the progress of a maturing society." The court's subsequent attempts to clarify and develop this "evolving standards of decency" test can be seen in two sets of cases in which social science offered critical insights. The first focuses on the punishment of individuals based on their status, as opposed to actual behaviors. The second concerns efforts to impose the death penalty.

Status versus behavior

Criminal sanctions are generally imposed in the wake of individually culpable conduct. Serious crimes require that the offender possess a particular state of mind, in legal terms, a *mens rea*. The conduct in question must, the law instructs, involve a particular type of decision or action. So, for example, the Model Penal Code speaks of the need for a complete criminal act to include mental states described as "willing," "knowing," "reckless," or "negligent." This raises an especially troubling concern: what should the law make of, and how should it assess, allegedly criminal acts where the "conduct" at the heart of the prosecution reflects an individual's status, rather than his or her actual behavior?

Two Supreme Court decisions illustrate both the problem and the value of social science research. In *Robinson v. California*, 370 U.S. 660 (1962), the Court held that a California statute criminalizing mere addiction to drugs, as opposed to usage, constituted cruel and unusual punishment. The court recognized that the individual being prosecuted may well have "actual[ly] use[d]… narcotics within the State's jurisdiction." That is, he may have engaged in criminally culpable conduct. However, the jury was instructed that it could convict "if they found simply that [Robinson's] 'status' or 'chronic condition' was that of being 'addicted to the use of narcotics'" (*Robinson v. California* 1962, 665).

The court rejected that approach. There was no proof that the defendant "touched any narcotic drug within the State or [was] guilty of any irregular behavior there." Rather, he was simply an addict, "an illness which may be contracted innocently or involuntarily" (*Robinson v. California* 1962, 667). Stressing the importance of "contemporary human knowledge," the majority recognized the problems posed by assigning criminal sanctions for simple status (*Robinson v. California* 1962, 666). Indeed, it declared that "[e]ven one day in prison would be a cruel and unusual punishment for the 'crime' of having a common cold" (*Robinson v. California* 1962, 667).

Further, in *Powell v. Texas*, 392 U.S. 514 (1968), the court considered a similar issue: if the state cannot punish a drug addict for addiction, then what about an alcoholic for public drunkenness? Here, the case hinged on whether public drunkenness was nothing more than an unavoidable consequence of a person's condition (here, alcoholism). If so, *Robinson* seemed to compel the conclusion that the Eighth Amendment prohibits any punishment.

The court did not, however, find a constitutional violation. Instead, it upheld a $50 fine against a man with a pronounced history of alcoholism after police found him publicly intoxicated. Writing for the court, albeit in a plurality opinion (which is not as authoritative as a true majority opinion), Justice Marshall looked carefully at the nature of alcoholism, including its definition(s), causes, status as a medical condition, impact on a person's culpability, and susceptibility to deterrence or rehabilitation. He stressed that, at least at that time, alcoholism remained a fairly new subject of academic inquiry that had not yet attained expert consensus, noting "the comparatively primitive state of our knowledge on the subject" (*Powell v. Texas* 1968, 526). Accordingly, the court was "unable to conclude … on the current state of medical knowledge, that chronic alcoholics … suffer from such an irresistible compulsion to drink and to get drunk in public that they are utterly unable to control their performance of either or both of these acts" (*Powell v. Texas* 1968, 535). More tellingly, he expressed the concern that a premature determination of an alcoholic's culpability for Eighth Amendment purposes would "freeze the developing productive dialogue between law and psychiatry into a rigid constitutional mold" and thereby "write the Constitutional formulas cast in terms whose meaning, let alone relevance, is not yet clear either to doctors or to lawyers" (*Powell v. Texas* 1968, 537).

In both cases, knowledge derived from the social sciences provided the frameworks within which the court made a determination about whether "evolving standards of decency" countenanced the imposition of punishment solely on the basis of status. Tellingly, the court was willing to fashion a rule when it was confident that the state of scientific knowledge supported that decision. However, when the information before it was not up to sufficient scientific standards, the court demurred.

Nature and conditions of punishment

The social sciences have been especially useful as a means for providing contexts in cases where guilt has been adjudicated and the focus is on the nature and scope of the resulting punishment. That process began with *Furman v. Georgia,* 408 U.S. 238 (1972), in which a sharply divided court found that the nation's death penalty practices violated the Eighth

Amendment. Notably, Justice Brennan, quoting from a report prepared for the American Law Institute as part of its formulation of the Model Penal Code, painted the debate over capital punishment as a clash between modernism and pre-modernism, with the behavioral sciences arrayed on the former's side:

> [T]he struggle about this punishment has been one between ancient and deeply rooted beliefs in retribution, atonement, or vengeance, on the one hand, and, on the other, beliefs in the personal value and dignity of the common man that were born of the democratic movement of the eighteenth century, as well as beliefs in the scientific approach to an understanding of the motive forces of human conduct, which are the result of the growth of the sciences of behavior during the nineteenth and twentieth centuries. (*Furman v. Georgia* 1972, 296)

Neither Justice Brennan nor his colleagues discussed in detail the behavioral sciences, nor their relationship to the death penalty. "Mainstream" social sciences did not, accordingly, play a determinative role in *Furman*. Nevertheless, the notion that they had a role was established.

One key question in subsequent cases was what part such studies would play. Are they evidence that sets the constitutional standard? Or are they simply evidence that may be applied to determine if the constitutional threshold has been met? In *Rhodes v. Chapman*, 452 U.S. 337 (1981), the court examined an Ohio penitentiary and found that the conditions within it were constitutional. Much of the discussion centered on the minimum square footage that a cell must have to ensure that a prisoner does not become overly cramped.

The majority criticized the lower court, stating that it "erred in assuming that opinions of experts as to desirable prison conditions suffice to establish contemporary standards of decency" and stressed that "such opinions may be helpful and relevant with respect to some questions, but they simply do not establish the constitutional minima; rather, they establish goals recommended by the organization in question" (*Rhodes v. Chapman* 1981, 348n13). Justice Brennan disagreed, concluding that "public health, medical, psychiatric, psychological, penological, architectural, structural, and other experts have proved useful to the lower courts in observing and interpreting prison conditions" (*Rhodes v. Chapman* 1981, 363). He further stated that "[a]lthough expert testimony alone does not suffice to establish contemporary standards of decency … such testimony can help the courts to understand the prevailing norms against which conditions in a particular prison may be evaluated" (*Rhodes v. Chapman* 1981, 364).

Justice Marshall, in turn, argued that while "[n]o one would suggest that a study, no matter how competent, could ever establish a constitutional rule … once the rule is established, it is surely the case that expert evidence can shed light on whether the rule is violated." More importantly, he indicated that the proper assessment of such evidence requires a sensitivity to those norms that typify the social sciences: "The majority … casts [this evidence] aside without even a token evaluation of the methodology, content, or results of any of the studies on which the District Court relied. If expert opinion is of as little value as the majority implies, then even plaintiffs with meritorious claims that their conditions of confinement violate the Eighth Amendment will have tremendous difficulty in proving their cases" (*Rhodes v. Chapman* 1981, 376).

Other Eighth Amendment cases have taken a different approach. In recent years, the court has concluded that a death sentence is per se unconstitutional when the defendant committed the offense while under age 18. In *Roper v. Simmons,* 543 U.S. 551 (2005), the majority made extensive use of expert opinion to reach three conclusions about minors: they have greater "immaturity and irresponsibility," are "more vulnerable or susceptible to negative influences and outside pressures," and possess a "character … not as well formed as that of an adult" (*Roper v. Simmons* 2005, 569–570). As a result, the court concluded that minors, as a class, cannot exhibit the especially heinous culpability necessary to deserve execution. The majority found particular significance in the diagnostic criteria for Antisocial Personality Disorder, as minors would not receive the diagnosis because of their age. According to the court, "[i]f trained psychiatrists with the advantage of clinical testing and observation refrain, despite diagnostic expertise, from assessing any juvenile under 18 as having antisocial personality disorder, we conclude that States should refrain from asking jurors to issue a far graver condemnation" (*Roper v. Simmons* 2005, 573).

The dissenting justices provided important perspectives. Justice O'Connor objected to the assumption that minors, as a class, all carry common psychological characteristics, arguing instead that trial courts should determine sufficient maturity "not by means of an arbitrary, categorical age-based rule, but rather through individualized sentencing in which juries are required to give appropriate mitigating weight to the defendant's immaturity, his susceptibility to outside pressures, his cognizance of the consequences of his actions, and so forth" (*Roper v. Simmons* 2005, 602–603). Justice Scalia, in turn, accused the majority of misusing "scientific and sociological studies, picking and choosing those that support its position" and of "never explain[ing] why those particular studies are methodologically sound" (*Roper v. Simmons* 2005, 617).

HUMAN MEMORY AND SUGGESTIBILITY: EYEWITNESS IDENTIFICATION

Another example of the interplay of social science on American law is in the area of eyewitness identification. Eyewitnesses can play important, pivotal roles in cases, bridging key players of the legal system (e.g., investigators, jurors, and judges) with events otherwise lost. An

eyewitness's senses detect nearby, unfolding events and transform that sensory input into memories stored within the brain. The eyewitness later articulates those memories to third parties, thereby creating impressions of what originally occurred. The problem is that human brains preserve scenes neither fully nor perfectly, so eyewitnesses' later recollections are not always entirely accurate and complete.

Psychologists have developed a wealth of research demonstrating limitations of eyewitness testimony. (See, e.g., Faigman et al. 2014.) These studies establish that memory fades with time (Faigman et al. 2014, 587), that eyewitnesses sometimes mesh subsequent events back into earlier ones to create single memories of what were, in reality, multiple scenes (Faigman et al. 2014, 587), and extreme stress can diminish the memory's quality (Faigman et al. 2014; Sandi 2007, 12.1.3, 12.1.4). Likewise, observers' ability to recall oral statements verbatim can be weak, because the human brain tends to capture the "gist" of another's comments, and not the actual words (Faigman et al. 2014, 574). Further, research shows that observers may struggle to accurately recall observees' physical appearances. For instance, psychologists have demonstrated a phenomenon termed "weapons focus," in which eyewitnesses experience greater difficulty remembering the physical characteristics of a person holding a weapon, because the eyewitness's attention naturally gravitates toward the weapon itself (Faigman et al. 2014, 586). Research has also demonstrated that observers are generally more error prone when remembering the appearances of a person of a different race (Faigman et al. 2014, 559, 584).

These factors in eyewitnesses' accuracy raise a key question for the courts: when one side's eyewitness testifies, should the other side be able to offer a social scientist as an expert witness about memory? Courts have largely agreed that experts "limit their testimony to the general principles derived from sound empirical research. Unlike clinicians, for instance, social scientists in this area do not pretend to have specific insights into the accuracy of particular witnesses" (Faigman et al. 2014, 527–528). For instance, if an individual observes a bank robbery, an expert cannot testify about the quality of that exact memory. The more contentious question is whether an expert witness can testify about the reliability of a generic eyewitness who fits a particular demographic profile and observes a given kind of scene under specific circumstances. Here, the psychologist might discuss issues impacting the accuracy of a female of Race A observing for 10 seconds a male of Race B as he holds a gun while running out of a bank on a rainy day.

Historically, courts were reluctant to admit such testimony. In part, they reasoned that limits on memory were sufficiently self-evident that jurors did not require expert testimony. This reasoning changed with the rise of DNA evidence and ensuing high-profile exonerations. Of overturned convictions, a disproportionately high number had involved eyewitness testimony as central to prosecutors' arguments. This phenomenon caused an increasing number of courts to reconsider their rules, particularly in cases when guilt might hinge on an eyewitness's identification. A growing number of courts, meanwhile, do not categorically exclude such expert testimony and instead follow the same rules for admissibility as in other circumstances involving expert testimony, particularly today's dominant *Daubert* and *Frye* tests (Faigman et al. 2014, 538–539).

Wrongful convictions have also caused law enforcement to rethink the procedures officers employ when interviewing witnesses. A 1999 report from the U.S. Department of Justice recommended practices for the collection and preservation of eyewitness evidence, proposing principles, policies, and procedures for law enforcement and prosecutors to interface with eyewitnesses and to process their testimony (Table 86.1). Future considerations to improve the reliability of eyewitness evidence included sequential and "blind" lineups.

Historically, eyewitnesses observe lineups simultaneously, which has potential for relative judgment: the witness may transform the task from identification ("Do I see the perpetrator?") to comparison ("Which person looks most like the one I saw?"). As one individual in the lineup might most resemble the witness's recollection, so increases

Table 86.1 Recommendations for eyewitness evidence

Examples	Reasoning
Ask open-ended questions (e.g., "What can you tell me about the car?"), instead of leading ones ("Was the car red?").	Questions themselves may generate false memories.
Instruct witnesses to avoid discussing details of the incident with other potential witnesses.	Witnesses may incorporate each other's recollections into their own memories.
Compose lineups so that suspect(s) do not stand out.	Witnesses may identify suspects (if present) merely for looking unique within lineups.
Emphasize that the true perpetrator might not be in the lineup, and that it is just as important to clear innocent persons from suspicion as it is to identify guilty parties. Assure witnesses that, regardless of whether an identification is made, authorities will continue to investigate the incident.	These statements lower the chances of witnesses feeling pressured to make (potentially incorrect) identifications.

Source: Adapted from U.S. Department of Justice. 1999. *Eyewitness Evidence: A Guide for Law Enforcement.* https://www.ncjrs.gov/pdffiles1/nij/178240.pdf, accessed July 5, 2016.

the chances of incorrect identification. This error might decrease with the practice of sequential lineup, in which the eyewitness sees participants one at a time, thus diminishing the comparative emphasis.

Another consideration draws from "double-blinding" in scientific methodology. As investigators may bias research subjects with unintentional cues (e.g., body language, or tone of voice), so too officers may unintentionally suggest suspects' identities to eyewitnesses during lineups. If, during the lineup, officers are unaware of actual suspects' identities, this practice could, in theory, improve the accuracy of eyewitness testimony.

PROTECTION OF RIGHTS IN THE JURY SYSTEM

One key aspect of the American system of justice is its use of the jury in both criminal and civil trials. This is more than a simple matter of preference: the right to an assessment of the facts and evidence by an "impartial" jury was a central element in the Bill of Rights. Behavioral research offers valuable perspectives about key aspects of the jury system. For example, how might a juror's world view impact his or her vote? Does it affect others' votes? Can experts assist in the selection of jurors to provide an advantage to one party and/or a "fairer" jury?

Courts have considered these questions with the assistance of behavioral and psychological research. As the following examples show, this research has played key roles in both the composition of a jury and its selection.

Death qualified juries

Juror attitudes about the death penalty have created an intersection between social science and the criminal justice system. Historically, during *voir dire* in capital cases, courts have allowed prosecutors to excuse for cause any potential juror unwilling to render a death sentence. Great dispute surrounds how emphatic and unambiguous this unwillingness must be, but courts and researchers have identified three general categories of capital case venire (jury pool) members:

1. Death qualified: Those willing, if appropriate, to find a defendant guilty and to impose a death sentence, even if they personally oppose the death penalty
2. Those who would impartially vote during the trial's guilt phase but, if the jury found the defendant guilty, would be unwilling to consider death as a possible punishment
3. Those who would vote not guilty in order to avoid the possibility of a death sentence during the penalty phase

Of particular concern is the relationship between a venire member's death penalty views at the trial's penalty phase and his or her voting tendencies during the guilt phase. In other words, are members of any category predisposed to find a generic defendant guilty (or guilty of a more serious charge) in the first place? Courts and researchers have grappled with this, and clashed over the answer.

In *Witherspoon v. Illinois*, 391 U.S. 510 (1968), the Supreme Court held that a sentence of death could not be carried out if the jury that imposed the sentence was chosen by excluding veniremen for cause simply because they voiced general objections to the death penalty. Because the excused veniremen had not stated that they would in all cases refuse to impose the death penalty, the court held that the resulting jury was "uncommonly willing to condemn a man to die" (*Witherspoon v. Illinois* 1968, 521). The court refused, however, to hold that a properly constructed death qualified jury is unconstitutional, stating that the then-available studies showing that death qualified juries were more prone to convict were "too tentative and fragmentary" to justify their use in formulating such a rule (*Witherspoon v. Illinois* 1968, 517). This prompted social scientists to develop a larger body of research focused on whether jurors who are willing to impose a death sentence are inclined to convict.

The court took up this question in *Lockhart v. McCree*, 476 U.S. 162 (1986), a case in which the jury convicted the defendant of a capital crime but did not sentence him to death. The defendant argued that because the trial court excluded individuals unwilling to impose a sentence of death (category 2 above) from both the guilt and penalty phases, the jury was unconstitutionally predisposed toward guilt. Various social science studies played prominent roles in the case and the justices discussed them at some length. The majority found them inadequate, declaring that "we are constrained to point out what we believe to be several serious flaws in the evidence upon which the courts below reached the conclusion that 'death qualification' produces 'conviction-prone' juries" (*Lockhart v. McCree* 1986, 168), concluding that "[w]e have serious doubts about the value of these studies in predicting the behavior of actual jurors" (*Lockhart v. McCree* 1986, 171).

Lockhart provides an important example of law directly confronting and dissecting a body of social science research. The majority and dissent felt that the studies deserved detailed comment, and these comments provide insight into the justices' approach to such data. The time between *Witherspoon* and *Lockhart* also demonstrates social scientists' responsiveness to the court's perceived needs. In 1968, the *Witherspoon* court noted a dearth of evidence. By 1986, researchers had made more studies available for review. The majority found these new studies still inadequate, yet the two cases demonstrate a dynamic between the judiciary and social science academics being well aware of each other. Judicial concerns about inadequate studies can cause scientists to conduct further investigations; new research findings may then trigger judicial analyses, praise, and directions for further study. This cycle may continue, expanding the knowledge base on both sides.

Choosing a jury and managing a trial: Trial consultants

Trial consultants also create a point of intersection between law and social science. Increasingly in recent decades, attorneys have turned to outside specialists who are not themselves lawyers, but who possess expertise directly relevant to trial management. Such consultants may offer services ranging from audio-visual support during an attorney's multimedia presentation in the courtroom to public relations management. Their roles vary, as do opinions about the usefulness and propriety of their services. The American Society of Trial Consultants, however, states that its goals "lie at the very heart of the law's ability to deliver justice." As set out in their organization's mission, trial consultants help "litigators become better at persuading jurors and other fact-finders, and that makes the system work in a way that is more meaningful, more reliable, and ultimately more fair" (American Society of Trial Consultants 2015).

A common function of trial consultants is to assist in jury selection. For instance, consultants might conduct telephone surveys of local residents, correlating demographic information with lay opinions on hypothetical facts comparable to the case at hand. Consultants might observe venire members' body language, tone, and answers, opining on potential jurors' hidden biases concerning the litigants. During trial, consultants might observe jurors' reactions, and can even bring in paid observers who match the jury's demographics. During court recesses, consultants can meet with those observers, gauge their reactions, and help the attorney to manage these concerns once trial resumes. Post-verdict, consultants may interview former jurors and learn information that serves as a basis for appeal, or be useful information for future clients.

Of course, such activities may require substantial funds. Some might argue that trial consultants function essentially as platinum litigation plans for affluent clients. Nevertheless, trial consultants create an important gateway for social scientists to involve themselves in legal processes.

A more fundamental question is whether indigent criminal defendants enjoy the right to government-funded trial consultants. This question implicates a wide range of situations claiming that the government must provide expert assistance. In legal terms, this is a question of "due process"—that is, an examination of the manner in which government acts and whether it is fair in light of the issues involved. These claims are assessed within the framework provided by *Mathews v. Eldridge*, 424 U.S. 319, 335 (1976), within which the court focused on three factors: (1) the nature of "the private interest that will be affected by the official action," (2) "the risk of an erroneous deprivation … and the probable value … of additional or substitute procedural safeguards," and (3) the nature of "the Government's interest…." So for example, in *Ake v. Oklahoma*, 470 U.S. 68 (1985), the court held that a criminal defendant who raises the serious possibility of an insanity defense must have access to a psychiatrist, stressing the importance of the indigent defendant having access to "the basic tools of an adequate defense or appeal" (*Ake v. Oklahoma* 1985, 77) and the "the probable value" of psychiatric assistance (*Ake v. Oklahoma* 1985, 79).

This means that when a court decides whether to provide a defendant with a trial consultant, it must balance the defendant's risk (here, of empaneling an inappropriately pro-prosecution jury), the government's interest (of conserving public funds and not creating an inordinately pro-defense jury), and the value of desired assistance (the trial consultant's abilities, e.g., to identify bias in the jury pool). The Supreme Court has not taken up this specific issue of a right to trial consultants, and most courts that have evaluated such requests have rejected them. Two observations made in these cases are especially interesting. The first is that the Constitution does not require "the state to provide … a most-sophisticated defense" and that "all competent lawyers are endowed" with what the *Ake* court characterized as the "raw materials" of a constitutionally sound defense, the ability to "pick a jury fairly disposed toward doing substantive justice" (*Moore v. Johnson*, 225 F.3d 495, 503 (5th Cir. 2000)). The second is the contention that the goal of a "jury-selection expert" is not necessarily to produce a fair and impartial jury, but rather "to bias the jury in his employer's favor" (*United States v. Mikos*, 539 F.3d 706, 713 (7th Cir. 2008)).

Each of these considerations is superficially appealing. Each is, nevertheless, subject to the critical investigations that scientists may provide when examining for possible bias. This is especially pertinent in cases where the stakes are pronounced, for example, those where the prosecution is seeking the death penalty. If, as many judges and attorneys argue, jury selection is the most important phase of any trial, the considered application of scientific insights in that process seems eminently just.

SUMMARY

Forensic psychiatry and the social sciences share common goals: the development of insights into human behavior and the formulation of tools and techniques that assist individuals and society. Oliver Wendell Holmes famously observed that "[t]he life of the law has not been logic: it has been experience" (Holmes 1963, 5). The insights into experience gleaned from the social sciences have, accordingly, played crucial roles in the development of law, and can enhance the forensic psychiatrist's efforts to assist patients and to improve public policy.

SUMMARY KEY POINTS

- Social sciences include psychology, sociology, criminology, anthropology, history, economics, and political science.
- Creating law and policy can engage dialogue between courts, psychiatry, and social science.
- Relevant to this dialogue are scientific methodology, accuracy of findings, and context.
- Eyewitness testimony and jury systems have strengths and limitations.

Community-based interventions for justice-involved individuals with serious mental disorders

ROBERT L. WEISMAN, J. STEVEN LAMBERTI, AND J. RICHARD CICCONE

INTRODUCTION

Over the past 50 years the supply of inpatient psychiatric beds in the United States has largely vanished. In 1955, 560,000 patients were cared for in state psychiatric facilities; today less than one-tenth that number exists. Given the doubling of the U.S. population, this equates to a 95% reduction, bringing the per capita public psychiatric bed count to what it was in 1850–1914 per 100,000 individuals (Torrey et al. 2012). As state hospitals were downsized and closed, many individuals with chronic psychiatric disorders became homeless, frequenting hospital emergency services for care, food, and shelter. As deinstitutionalization progressed throughout the 1960s, 1970s, and 1980s, individuals with serious mental disorders also began entering correctional facilities.

By the 1990s and 2000s, a growing number of sources began reporting that persons with serious mental disorders were overrepresented within the criminal justice system—the new asylums. On March 5, 1998, the *New York Times* featured a front-page headline proclaiming "Prisons Replace Hospitals for the Nation's Mentally Ill" (Butterfield 1998). In 2003, a Human Rights Watch study reported that more individuals with serious mental illnesses reside in prisons than in hospitals (Human Rights Watch 2003). In addition, studies by Teplin and colleagues (Teplin 1984) and survey data from the U.S. Bureau of Justice Statistics (Ditton 1999) suggested that the prevalence of serious mental disorders in correctional facilities was two to four times higher than the general population rate. This problem is not limited to correctional facilities. Studies also found very high rates of serious mental disorders among the large population of individuals on probation in the community (Ditton 1999; Crilly et al. 2009).

Although some of these mentally ill individuals have committed violent acts, most have been arrested for relatively minor crimes such as theft, vagrancy, or disorderly conduct (Vladiserri et al. 1986). In addition, people with serious mental disorders are unlikely to receive adequate treatment they need while incarcerated. According to a Department of Justice report on treatment of mentally ill inmates and probationers, treatment is typically limited to medications, with approximately half of mentally ill individuals receiving no treatment at all (Ditton 1999). This lack of treatment contributes to disciplinary problems and to the high rate of suicides observed among mentally ill inmates (Hayes 1995; Human Rights Watch 2003; James and Glaze 2006). Once released from correctional facilities, mentally ill persons are left with little support, and reincarceration rates are two to three times higher than those prisoners without serious mental illness (Baillargeon et al. 2009). Overall, these reports highlighted the need for intervention strategies aimed at transitioning persons with severe mental illnesses out of jails and prisons, as well as preventing their recidivism.

As noted by Sisti et al., these concerns are not new: "Dorothea Dix, Moses Sheppard, Thomas Scattergood, and other 19th century reformers decried the poor treatment of the mentally ill in jails, poor houses, and asylums of the day. They called for a new kind of refuge in which mentally ill persons could live and heal, built on principles of humane and moral treatment." Sadly, disproportionate numbers of people with serious mental disorders today live in environments that are anathema to goals of treatment and recovery as they continue to cycle through jails, hospitals, and the streets (Sisti et al. 2015).

CURRENT INTERVENTIONS FOR JUSTICE-INVOLVED INDIVIDUALS WITH SERIOUS MENTAL DISORDERS

The term *justice-involved* describes mentally ill persons who are actively involved with the criminal justice system. This definition includes incarcerated individuals as well as those under community supervision by a judge, probation officer,

or other criminal justice system representatives. The term may also be applied to individuals with histories of repeated arrest or incarceration because of their frequent contact with criminal justice authorities. Several approaches are currently in use for mentally ill individuals who are actively involved with or at high risk for involvement with the criminal justice system. Because these strategies are generally aimed at preventing incarceration, they are sometimes broadly referred to as "jail diversion" strategies. Jail diversion strategies are a diverse group of interventions that are based in jail, court, and community settings. Given their diversity, a helpful framework for understanding and organizing intervention strategies aimed at preventing criminal justice system involvement is called the *Sequential Intercept Model* (Munetz and Griffin 2006).

According to the model, individuals who are arrested will move through the criminal justice system in a series of five predictable steps or "intercepts." Each provides an opportunity to identify individuals with serious mental disorders and to divert them into necessary treatments and services. The intercepts and examples of corresponding interventions are as follows:

- *Intercept 1: Law Enforcement and Emergency Services*. This intercept represents the initial point of contact for mentally ill individuals who become involved with the criminal justice system. A variety of police-based diversion strategies have been developed at this intercept, the most widely disseminated being Crisis Intervention Teams (CITs) (Franz and Borum 2010). CIT utilizes a 40-hour curriculum to train police and emergency responders how to identify mentally ill persons, how to intervene nonviolently, and how to divert them to emergency rooms instead of to jail.
- *Intercept 2: Initial Detention and Initial Court Hearings*. This intercept encompasses jail and court-based activities that take place following arrest. The predominant approach to jail diversion at this intercept is Pre-Trial Diversion (Camilletti 2010). This strategy is an alternative to prosecution that involves early identification of mentally ill detainees, negotiation with the district attorney and public defender, and diversion into treatment.
- *Intercept 3: Courts and Corrections*. The third intercept encompasses an array of specialized court-based approaches that include mental health court, drug court, and veterans' court. Specialty courts utilize a judge to oversee a mentally ill defendant's outpatient treatment progress in partnership with the individual's treatment providers. In addition, conditional release statutes are used by nonspecialty courts to engage mentally ill individuals in treatment and services by offering them as a condition of release from jail.
- *Intercept 4: Re-Entry from Jails and Prisons*. This intercept represents the critical period of transition from correctional facilities back into the community. A common approach to helping individuals make this transition is called Transitional Case Management (Ventura et al. 1998). This approach utilizes jail-based case managers who prepare clients for release by arranging for insurance re-instatement, medication provision, housing, and follow-up treatment appointments.
- *Intercept 5: Community Corrections*. The last intercept encompasses the activities of probation and parole officers. Probation is the most common correctional disposition, and it functions to prevent recidivism by ensuring compliance with court-ordered conditions. Other community-based approaches to preventing incarceration include assisted outpatient treatment (AOT) programs such as those operating under Kendra's Law in New York and Laura's Law in California, and forensic assertive community treatment (FACT) programs (Lamberti and Weisman 2010).

A central characteristic shared by these intervention strategies is the use of legal authority to direct mentally ill individuals to treatment. Although published reviews suggest that authority-based strategies improve adherence to psychiatric care, evidence that they prevent criminal recidivism among justice-involved adults with serious mental disorders is lacking. A 2009 review of 21 published jail diversion studies "revealed little evidence of the effectiveness of jail diversion in reducing recidivism among persons with serious mental illness" (Sirotich 2009). Also, two large randomized controlled trials of AOT (also called outpatient commitment) have been conducted, and neither found a significant effect on reducing criminal involvement (Steadman et al. 2001; Swartz et al. 2001). In addition, a recent Cochrane Review of various forms of mandated treatment concluded, "We found little evidence that compulsory treatment was effective" (Kisely et al. 2011).

In considering how to prevent criminal recidivism among justice-involved adults with serious mental disorders, it is necessary to understand why mentally ill persons become involved with the criminal justice system. The conventional wisdom has been that deinstitutionalization and lack of access to psychiatric treatment are the primary causes (Torrey 1997; Daly 2006) and, therefore, the solution is simply to divert justice-involved individuals into existing psychiatric treatment programs. However, this approach fails to recognize why some people with serious mental disorders become involved with the criminal justice system, while others do not. What is different about justice-involved individuals?

UNDERSTANDING THE CYCLE OF RECIDIVISM

The failure of deinstitutionalization as an explanatory model has recently led researchers and policy makers to seek a criminologically informed framework for understanding and preventing criminal recidivism (Fisher et al. 2006; Lamberti 2007). Though separate from psychiatry and mental health, the field of criminology is relevant to

the question of criminal justice involvement because criminology is the study of crime, the causes of crime, and crime prevention. Within the field, the predominant framework for understanding and preventing criminal behavior is the Risk–Needs–Responsitivity (RNR) Model (Andrews et al. 2006; Taxman and Marlowe 2006). This model states that preventing crime requires targeting specific risk factors that drive criminality with interventions that are matched to each individual's level of motivation, learning style, and circumstances. Based on decades of research, eight main risk factors have been identified that are predictive of criminal behavior whether or not a person has a mental disorder (Andrews and Bonta 2010). Standardized risk assessment tools such as the Level of Service Inventory—Revised (LSI-R), the Wisconsin Risk and Needs (WRN), and the Psychopathy Checklist—Revised (PCL-R) have incorporated these risk factors to varying degrees. These tools are commonly used to predict risk of criminal re-offense and probability of rehabilitation for individuals within high-security psychiatric wards or prison settings with the aim of determining who should be detained or released.

Also known as "criminogenic risk factors," the eight major risk factors are listed below:

- *History of Antisocial Behavior*: An individual's criminal record as well as past antisocial behaviors that may not have resulted in arrest. Risk increases with having a large number of prior offenses, being arrested at a young age, and having violations while on conditional release.
- *Antisocial Personality Pattern*: A pervasive and long-standing pattern of disregard for and violation of the rights of others (American Psychiatric Association 2013). Antisocial personality is characterized by failure to abide by the law, impulsivity, irresponsibility, lying, lack of remorse, and callous disregard for safety of self or others.
- *Antisocial Cognition*: Thoughts, rationalizations, beliefs, and attitudes that are favorable to crime. These can include rationalizations that justify crime (e.g., "the victim deserved it," "it's OK to steal from rich people," etc.), beliefs that crime will yield benefits, and negative attitudes toward law enforcement and the criminal justice system.
- *Antisocial Associates*: Also called "social support for crime," this risk factor includes both association with criminal companions as well as relative isolation from friends, family, and others who are law-abiding citizens.
- *Substance Abuse*: Problems with alcohol and drugs excluding tobacco and caffeine. Risk applies both to history of abuse and current abuse, and it is highest when active abuse is present.
- *School/Work*: Lack of educational and vocational achievement as well as history of interpersonal conflicts and lack of satisfaction within those environments. This risk factor can include history of truancy and disciplinary problems, failure to graduate from high school, unemployment, or a pattern of unstable employment.
- *Family/Marital Circumstances*: Quality of relationships with family members, including spouses if married. For young people, the risk factor can include a lack of nurturing by and/or a lack of caring toward parental figures. For married individuals, it can include lack of mutual caring, respect, and interest.
- *Leisure/Recreation*: Low levels of participation and satisfaction in prosocial leisure pursuits. This risk factor can include lack of hobbies, interests, club memberships, or other constructive pastime activities.

It is noteworthy that mental illness has largely been viewed by the field of criminology as noncontributory to criminal justice system involvement (Bonta et al. 1998). This perspective is at odds with the experience of clinicians, who have observed their patients being arrested for what amounts to being psychotic in the wrong place at the wrong time. Research within the mental health field has provided considerable evidence that untreated psychotic symptoms are, in fact, a risk factor for arrest and incarceration (McNiel et al. 2000; Swanson et al. 2006). Behaviors related to manic episodes such as driving recklessly, risky sexual encounters, and other forms of impulsivity can also lead directly to arrest and incarceration. In addition to symptoms of psychosis and mania, people with serious mental disorders have higher prevalence rates of the eight established risk factors. For instance, individuals with schizophrenia and related disorders have approximately five times the rate of substance abuse (Regier et al. 1990) and 10 times the rate of unemployment compared to the general population (Rosenheck et al. 2006). These findings provide a clear rationale to understanding why disproportionate numbers of mentally ill individuals enter the criminal justice system, along with implications for how their criminal recidivism might be prevented.

Consistent with the Risk–Needs–Responsivity model, the key to preventing criminal recidivism among justice-involved adults with serious mental disorders is to engage them in interventions that target the risk factors driving their recidivism. With the exception of history of antisocial behavior which cannot be changed, criminogenic risk factors among adults with serious mental disorders are potentially modifiable with appropriate intervention strategies. In recent years, evidence-based interventions have emerged that can be used to address modifiable risk factors among justice-involved adults with serious mental disorders in community settings. Examples include integrated dual diagnosis treatment for co-occurring substance use disorders (Drake et al. 2001), individual placement and support for unemployment (Bond 1998), and family therapy and support to address family problems (Marsh 1998). In addition, promising new cognitive behavioral approaches have been developed for antisocial cognitions (Little and Robinson 1988; Ross and Fabiano 1991; Hornsveld et al. 2008; Bush et al. 2011). Despite the recent emergence of effective interventions that target criminogenic risk factors, however, engaging individuals with serious mental disorders in the

community with necessary treatments and services is easier said than done.

Nonadherence is common among justice-involved individuals with serious mental disorders in community settings. Research suggests that half of all outpatients with schizophrenia are nonadherent with medications (Barkhof et al. 2012), and that approximately 90% of all mentally ill inmates were nonadherent with treatment prior to their arrest (Lamb et al. 2007). Persons with serious mental disorders may refuse needed treatments and services for several reasons, including paranoia, cognitive impairments, impaired judgment due to drug addiction, negative family influences, and fear of stigma. Some mentally ill individuals are unaware that they are ill and, as a result, see no need for treatment. These individual risk factors for nonadherence interact with well-documented deficiencies in our service delivery system. In the first state-by-state report on the nation's mental health system in 2009, the United States received a "D" grade due to multiple deficiencies (Aron et al. 2009). These deficiencies in our mental health system, or systemic risk factors, include lack of outreach, limited hours, lack of appropriate housing, cultural and language barriers, fragmentation of care, and financial barriers. When a person with multiple individual risk factors encounters a system with multiple deficiencies, the likelihood of treatment nonadherence increases dramatically. The relationship between individual and systemic risk factors, nonadherence, and jail and hospital recidivism is called the *cycle of recidivism*. This cycle is illustrated in Figure 87.1.

Justice-involved individuals with serious mental illness are often labeled as nonadherent or "noncompliant" by care providers when they fail to engage in treatment. However, it is more useful to view nonadherence as a mismatch between people and systems of care. Consider the example of a homeless man with bipolar disorder and alcoholism whose case was closed due to nonadherence because of his repeated failure to show for scheduled outpatient clinic appointments. If the outpatient clinic had provided the man with outreach along with hot coffee and sandwiches, he may have engaged in care.

If high-risk individuals with serious mental illness are not engaged in necessary treatments and services, they are likely to behave in ways that can lead to hospitalization or incarceration. Such behaviors may include public intoxication, trespassing, agitation, verbal harassment, and/or physical assaultiveness. Whether problem behaviors result in an individual being jailed or hospitalized can depend on who intervenes and the surrounding circumstances. For example, a young man who smashes a television in response to hearing voices would probably be arrested and sent to jail if this behavior occurred at a shopping mall. However, the same young man would probably be sent to a hospital if the event happened at his mother's house. Once released from jail or discharged from the hospital, however, such individuals remain at risk for continuing the cycle of recidivism unless engaged in effective interventions to break the cycle.

ENGAGING JUSTICE-INVOLVED INDIVIDUALS WITH SERIOUS MENTAL DISORDERS

The first step in engaging justice-involved individuals is to optimize treatments and services, with the understanding that nonadherence has both individual and systemic causes. Many individuals with serious mental disorders who are nonadherent in the context of lack of outreach, lack of transportation, drug side effects, treatment ineffectiveness, financial barriers, or cultural and language barriers can eventually be engaged once those issues have been addressed. Strategies to optimize care through establishing rapport, providing education, offering choices, minimizing drug side effects, utilizing long-acting injectable medications, providing outreach visits, and promoting cultural competence are cornerstones of promoting adherence. However, sometimes optimizing care is not enough. Some justice-involved adults with serious mental disorders remain unwilling or unable to engage with community-based treatments and services despite optimization. When such individuals engage in criminal activity or prove dangerous to themselves or others, they become candidates for intervention strategies involving the use of legal leverage.

Legal leverage is the process of using legal authority to engage justice-involved individuals with serious mental disorders and/or chemical dependency into necessary treatments and services (Lamberti et al. 2014). Legal authority can originate from several sources within the criminal justice system, including judges, probation and parole officers,

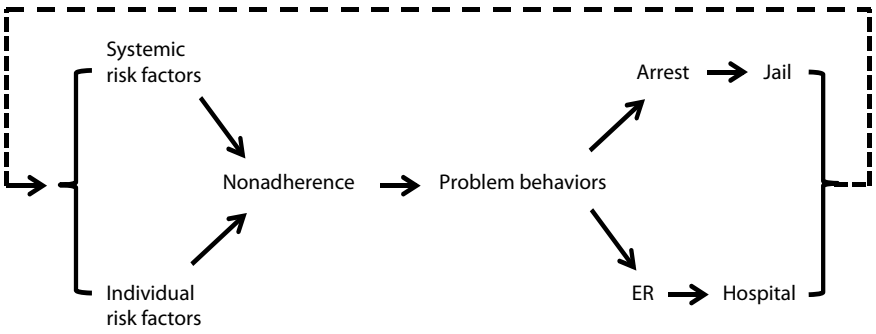

Figure 87.1 The cycle of recidivism

pretrial service officers, and police officers. In addition, legal authority can originate from "civil" sources such as forensic case monitors within the forensic system. The effectiveness of legal leverage-based strategies to prevent criminal recidivism among persons with serious mental disorders is likely to depend on several factors. Consistent with risk–needs–responsivity theory, one key factor is the effectiveness of those interventions to which individuals are being leveraged. Legal leverage is unlikely to prevent recidivism if an individual is leveraged to receive standard psychiatric treatment that fails to address the risk factors driving that individual's recidivism. Given that justice-involved individuals are involved in both service systems, another crucial factor is the willingness of mental health and criminal justice professionals to work together.

Collaboration between criminal justice and mental health professionals can prove challenging because of their different work environments, priorities, and goals. Mental health professionals typically work within clinics and hospitals that are geographically separate from courts, jails, and prisons. While criminal justice professionals fight crime and protect public safety, mental health professionals fight disease and promote personal health. And while mental health professionals work within a collaborative culture and utilize a relational style of communication with patients, criminal justice professionals work within an adversarial culture and utilize an authoritarian communication style with defendants. In addition to having different cultures and priorities, regulations surrounding information sharing can present barriers to collaboration. Mental health service providers are bound by Health Insurance Portability and Accountability Act (HIPAA) law and protecting patient confidentiality. Attorneys are bound by attorney–client privilege and laws and policies governing interagency communication. In addition to federal and state laws, local or agency-level policies and administrative rulings may bear consideration. Despite these potential challenges and barriers, effective mental health–criminal justice collaboration may hold the key to preventing criminal recidivism among mentally ill persons who straddle both systems.

To appreciate the importance of mental health and criminal justice collaboration, one must recognize that optimal use of legal leverage involves a process rather than a single event of "diverting" an individual from one system into another. Whenever mentally ill individuals enter probation, parole, or a mental health court, criminal justice and mental health professionals will go through a similar series of steps in serving them. Both must engage and assess each mentally ill individual, and both must generate a plan based on their assessments. Likewise, both monitor each individual for adherence to the plan, and both must address behavioral problems that emerge during the course of plan implementation. Unfortunately, these processes typically occur in a parallel, disconnected manner that can result in a person with serious mental illness falling through the cracks. The following example illustrates some of the pitfalls that can occur in the absence of active collaboration between mental health and criminal justice professionals who work with justice-involved individuals in community settings.

Case vignette—Diego, part 1

Diego is a 25-year-old homeless Hispanic man with schizoaffective disorder and alcohol use disorder who is arrested for indecency after urinating on a public sidewalk. Recognizing that he is mentally ill, police take Diego to an emergency room instead of jail. There his blood alcohol level is found to be three times the legal limit. The following morning he is assessed by the emergency room psychiatrist who finds him to be paranoid but not a danger to himself or others. Diego is subsequently discharged to a homeless shelter, and to the local mental health clinic where he fails to show for his appointments. A month later he is arrested after punching a convenience store attendant, and he is jailed for 7 months. His release plan includes treatment at the local mental health clinic and probation. Diego reluctantly attends his first mental health appointment at the insistence of his probation officer, but he has difficulty understanding the clinic psychiatrist due to hearing voices and his limited English. The psychiatrist writes a prescription for antipsychotic medication, but Diego discards it and subsequently reports to his probation officer in a psychotic state. When the probation officer calls the clinic to schedule an urgent appointment, Diego is given the next available appointment in 3 weeks. Diego starts drinking heavily and fails to show for his follow-up clinic appointments. The mental health clinic closes his case due to treatment nonadherence.

PRINCIPLES OF MENTAL HEALTH–CRIMINAL JUSTICE COLLABORATION

Collaboration is generally defined as the action of working with another person to achieve a common goal. It can also be defined as traitorous cooperation with an enemy (Merriam-Webster.com 2007). Given the substantial differences that exist between mental health and criminal justice professionals, it is necessary to share common principles in order to prevent criminal recidivism among individuals with serious mental disorders. Prospective collaborators should adopt the principle that promoting client health and protecting public safety are complementary rather than competing goals. Justice-involved individuals with serious mental disorders are members of society, and targeting the health-related and social issues that drive their criminal behavior will ultimately benefit society. Although specific decisions about when to err on the side of health or safety must be made on a case-by-case basis, acknowledging the complementary nature of these goals can provide a foundation for effective collaboration.

Offering treatment to mentally ill individuals as an alternative to punishment is a controversial issue, and some suggest offering treatment alternatives to incarceration is being "soft on crime." If the goal of intervention is to prevent crime, however, then it must be recognized that many of the factors driving criminal behavior of the mentally ill may be modifiable with appropriate treatments and services. Offering necessary interventions in combination with careful monitoring should therefore be seen as a strategy for preventing crime rather than enabling it. The perspective that effective treatment can be considered as a legitimate alternative to punishment has recently emerged within legal circles as "therapeutic jurisprudence," the study of law as a therapeutic agent (Wexler 1990).

Community-based care of justice-involved adults with serious mental disorders rarely proceeds smoothly. Typically this treatment course involves a backward step for every two steps forward. Problematic behaviors should be expected when working with this high-risk population. As a result, problem-solving approaches should be used to address behavioral problems whenever possible. Depending on the seriousness of the behaviors and applicable laws, problem-solving approaches can include offering new treatments and services as well as promoting adherence to existing treatments and services through motivational enhancement strategies. Persons with serious mental disorders may also benefit from having second chances, particularly in instances where they had limited control or when they self-report and acknowledge their problem behaviors. When sanctions are necessary, least restrictive alternative should be considered, such as increased monitoring, work assignments, community service assignments, writing assignments, curfew restrictions, and loss of privileges for those in residential programs.

Another important principle of mental health and criminal justice collaboration is that legal decisions about how to manage behavior problems should be clinically informed. Criminal justice authorities are clearly "the deciders" in determining how to respond to problematic behaviors from a legal standpoint. However, mental health professionals bring a wealth of knowledge about mental illness, effective treatment options, and availability of services and supports in the community. In addition, treating clinicians generally have a high degree of familiarity with each individual under their care. As such, mental health professionals are positioned to enhance the legal decision-making process by sharing their knowledge and experience. Shared decision making involves active discussion and sharing of opinions and ideas between mental health and criminal justice professionals, rather than a simple reporting relationship. In reporting relationships, mental health professionals essentially become extensions of the criminal justice system by serving only to report patient infractions such as illegal drug use to the authorities. Research has suggested that such relationships can actually serve to increase rather than decrease criminal justice system involvement (Solomon and Draine 1995).

THE ROCHESTER FORENSIC ASSERTIVE COMMUNITY TREATMENT (R-FACT) MODEL

The search for effective intervention strategies to help individuals who repeatedly cycle through jails and prisons has led clinicians and researchers to consider the assertive community treatment (ACT) model. ACT emerged in the 1970s as a means of bridging the gap between state hospitals and the community during the deinstitutionalization era by using mobile treatment teams to provide outreach for those with serious mental disorders who were in need. As the ACT model developed, it incorporated additional elements to meet the special needs of these individuals, including addiction treatment, employment assistance, and housing assistance. ACT teams also provide around-the-clock availability and include a half-time psychiatrist for every 50 enrollees to ensure optimal treatment. Although the model addressed mental health system deficiencies as well as some of the known recidivism risk factors, research showed that ACT had little or no effect on reducing rates of arrest and incarceration (Mueser et al. 1998; Bond et al. 2001). Despite publication of these findings in academic journals, frontline care providers continued adapting the ACT model in different ways to manage justice-involved individuals. These various adaptations of the ACT model became generally known as forensic assertive community treatment (FACT) programs (Lamberti and Weisman 2010).

The first FACT programs recognized by the American Psychiatric Association were Project Link in 1999, in Rochester, New York (Gold Award 1999), followed by Chicago's Thresholds Jail Linkage Project in 2001 (Gold Award 2001). Unlike traditional ACT programs, these emerging FACT programs had a strong criminal justice orientation and were designed to serve individuals involved with the criminal justice or forensic service systems. Their referrals usually arose from jails, courts, probation or parole officers, forensic hospitals, or other sources within the criminal justice or forensic systems. Although standard ACT teams typically enroll some individuals with criminal histories, such persons are admitted more by default than by design. FACT team staff are informed about the criminal justice system, and educated regarding criminal justice procedures and the roles and responsibilities of criminal justice staff members. Despite these similarities, however, national survey studies subsequently demonstrated great variability between existing "FACT" programs in terms of their structure, function, and daily operation (Lamberti et al. 2004; Lamberti et al. 2011).

The Rochester Forensic Assertive Community Treatment (R-FACT) model was developed at the University of Rochester through a National Institute of Mental Health (NIMH)-funded research project aimed at standardizing and testing the FACT intervention. Funding enabled the Rochester research team to travel to FACT programs across

the country, to conduct focus groups with service providers and recipients, and to consult with national experts and program stakeholders. This process led to identification and incorporation of two key elements that distinguish the R-FACT model: targeting of criminogenic risk factors and use of legal leverage. R-FACT is designed to break the cycle of recidivism by utilizing legal leverage derived from a court, assisted outpatient treatment, and probation to promote engagement in evidence-based treatments and services that target recidivism risk factors. This process involves combining risk assessment with standard clinical assessment for early identification of criminogenic risk factors, and active collaboration with criminal justice partners for optimal use of legal leverage to engage individuals in necessary treatment and service interventions. A randomized controlled study of 70 justice-involved adults with schizophrenia and related disorders compared R-FACT to community mental health treatment as usual with case management. Individuals receiving usual treatment spent twice as much time in jail and half as much time engaged in outpatient treatment as those receiving R-FACT (Lamberti and Weisman 2014). Further research is needed to determine critical elements of the model, to identify which justice-involved individuals are most appropriate for this intervention, and to examine the model's generalizability to different geographic regions.

Case vignette—Diego, part 2

Diego is arrested after swearing at pedestrians while panhandling. He is again taken by police to the emergency room instead of jail. There he is briefly hospitalized for treatment of his psychosis with an oral antipsychotic medication. Because of his history of multiple arrests, he is discharged back to the homeless shelter along with follow-up by an R-FACT team. The team transports Diego to the shelter on his day of discharge, and he is relieved to learn that one of the team members is bi-lingual in Spanish. Diego and the team member chat in Spanish on their way to the shelter, and they discover that they had attended the same high school. One week later Diego gets into a loud verbal altercation at the homeless shelter after accusing another resident of staring at him. The shelter calls the R-FACT team who evaluate Diego later that day. The team determines that he has stopped his antipsychotic medications and that he has started drinking again. They call Diego's probation officer who agrees to a joint meeting. After discussing treatment options with the R-FACT team psychiatrist, the probation officer offers Diego a choice: either accept a long-acting injectable form of antipsychotic medication and alcoholism treatment, or receive a violation for failure to adhere to his conditions of probation. Faced with the possibility of re-incarceration and feeling comfortable with his new treatment team, Diego agrees to accept the proposed plan.

SUMMARY

The reduction of beds and closure of psychiatric hospitals, along with the expansion of correctional facilities across the United States have together created a new clinical entity—the "justice-involved" patient. Increasingly large numbers of serious mentally ill patients are now being referred from local jails and state prisons to community mental health agencies. This new population of "justice-involved" patients requires new treatment approaches in order to prevent recidivism and promote recovery in the community.

SUMMARY KEY POINTS

- Persons with serious mental disorders are overrepresented within the criminal justice system and, once released, they experience rates of reincarceration two to three times that of persons without mental illness.
- The key to preventing criminal recidivism among justice-involved adults with serious mental disorders is to engage them in treatments and services that target the criminogenic risk factors driving their recidivism.
- Although many individuals with serious mental disorders can be engaged by optimizing treatments and services, some will be caught in the cycle of recidivism because they remain unwilling or unable to engage in necessary care.
- Legal leverage is the process of using legal authority to engage justice-involved individuals with serious mental disorders into necessary treatments and services.
- Optimal legal leverage for justice-involved patients in community settings requires active and ongoing collaboration between mental health professionals and criminal justice authorities that is based upon shared goals and principles.
- R-FACT is an example of an intervention strategy designed to break the cycle of recidivism by utilizing legal leverage to engage justice-involved individuals in interventions that target the risk factors driving the cycle.

Employee Retirement Income Security Act (ERISA)

J. RICHARD CICCONE

INTRODUCTION

On Labor Day 1974, President Gerald Ford signed the Employee Retirement Income Security Act (ERISA) into law (29 U.S.C. §§1001–1046). This law played a significant role in the restructuring of health care, and made health-care reform more difficult. The purpose of this chapter is to provide (a) a brief background of the events that led to enactment of the law; (b) an overview of the relationship of ERISA to health-care plans; and (c) a review of some attempts to have the courts remedy impediments to health care that managed care companies constructed by using ERISA as a shield.

ERISA'S ORIGINS

In order to understand the development and structure of ERISA and how it bears on health care, one must trace the development of retirement plans, which was (and is) the primary subject of ERISA. The U.S. pension system grew rapidly during the 1940s and 1950s in part because employers increased retirement benefits when wage freezes were imposed during World War II. Participation in pensions by union workers was boosted in 1948 when the U.S. Court of Appeals (7th Circuit) held that pensions are a form of remuneration for labor under the National Labor Relations Act (*Inland Steel Company v. NLRB* 1948). As a form of pay, pensions were a mandatory subject of collective bargaining and, therefore, an issue employers could not avoid.

Regulations had failed to keep up with the growth of pension assets and, in 1958, after learning of extensive abuses in pension plans, Congress enacted the Welfare Pension Plans Disclosure Act (29 U.S.C. §§301–308). The law was an attempt to protect the pension assets of employee participants and beneficiaries against companies that would use the money for operating costs.

Despite the protections provided under this Disclosure Act and other laws, abuses continued, and in March 1962 President Kennedy established the cabinet-level Committee on Corporate Pension Funds. Although the committee was working, significant abuses of pension funds continued. In December 1963, the Studebaker automobile plant in South Bend, Indiana, shut down. When the plant closed, the single-employer pension plan that had been negotiated between the United Automobile Workers and the Studebaker company did not have the funds to provide benefits for all its vested employees. Retirees and workers who had reached age 60 years at the time of the company's closure received full lifetime annuities; however, about 4000 employees who were vested received lump sum payments equal to only 15% of the actuarial value of their accrued pension.

In 1965, the Kennedy Committee on Corporate Pension Funds issued a report that reaffirmed the value of private pension programs and severely criticized government regulation of pension plans for not providing adequate protection of the pension funds. It recommended that to ensure the continued development of the private pension system, Congress should enact more substantive legislation to protect the pension plan participants and beneficiaries.

Accounts of older workers losing pension benefits they had earned over decades because of plan terminations, lay-offs, or misuse (stealing) of pension funds captured the media's attention and rallied public support in favor of reform. During a 1966 Senate hearing held in the wake of the Studebaker incident and the Kennedy Committee, Nolan Miller, a 60-year-old former Studebaker employee who worked at the company for 38 years, testified that the news that he did not reach the age of 60 in time to be given a full pension was bitter news indeed (Reilly 1994).

In May 1972, the Chairman of the Senate Labor and Public Welfare Committee, Harrison Williams, and ranking Minority Member Jacob Javits, introduced a bill intended to remedy the problems with existing pension plan law. In September 1972, the Senate Labor Committee approved the bill. The bill, which as enacted became ERISA, was designed to protect pension plans by establishing national standards

for funding and payment. To minimize administrative and financial burden of maintaining a pension plan, ERISA would preempt all state laws on the subject. This preemption permitted employers whose operations crossed state lines to have one employee benefit plan that applied to all its employees, despite the employees being in various states. At the eleventh hour, the House Committee extended ERISA's scope to include all employee benefit plans. This extended ERISA's preemption to state laws governing health plans as well as pension plans. Preemption affects not just state statutes but also common law remedies such as actions in tort, of which malpractice is a subcategory.

ERISA's primary purpose was to provide a scheme for the protection of employees' pension funds. As an afterthought, all employee benefit plans were added to the ERISA legislation. ERISA is a complicated, multifaceted law. Stone has written that "ERISA as it relates to health benefits, presents an array of technical legal rules and distinctions that test the comprehension of seasoned attorneys" (Stone 1999). ERISA came to have a profound effect on the health-care system, including the provision of inpatient and outpatient psychiatric care.

ERISA PLANS

Definitions

Prior to describing ERISA's impact on health-care plans, it is necessary first to understand those parts of the statute that are especially relevant. ERISA restrictions, protections, and regulations apply generally to ERISA plans. ERISA plans include "pension benefit plans" and "welfare benefit plans." Health-care plans are considered welfare benefit plans. The definition of welfare benefit plan includes the following elements:

- It is established or maintained by an employer, employee organization, or both
- It provides medical coverage
- The benefits may be provided through the purchase of commercial insurance or a self-insurance fund

ERISA has a number of components that affect health-care plans, hospitals, and physicians. If a health-care plan is a "governmental plan" or "church plan" it is not subject to ERISA; therefore, ERISA applies only to private-sector health-care plans. States cannot require ERISA self-insured plans to cover particular benefits. ERISA provides compensation for care that is wrongly denied but does not provide a remedy for beneficiaries who are harmed by a prospective denial of benefits. Also of note is that ERISA does not protect hospitals or physicians that provide care from liability.

Remedies under ERISA

When a plan participant has a grievance, ERISA does provide remedies, though such remedies are limited. In particular, under Section 502(a)(1)(B) of ERISA, plaintiffs may not recover extracontractual damages such as those sought in typical malpractice claims. This restriction has protected ERISA health-care plans from being sued for malpractice in state courts. A plaintiff who has been denied benefits may not recover compensatory damages. Even when the denial of benefits leads to disastrous consequences, the plaintiff may not be granted punitive damages. This restriction may be reasonable for a pension plan. For example, assume the pension plan has $1000, and each of 10 participants is to receive $100. If a participant is improperly denied the $100, the remedy is to award the $100; to award more than the $100 would be to take money away from other retirees. It is unclear that this restriction is reasonable for a health-care plan, where compensatory and punitive damages can encourage the provision of nonnegligent care.

ERISA usually preempts state claims for damages. This preemption is based on two provisions in ERISA. Section 502 describes complete preemption, and Section 514 describes conflict preemption. Each of these sections is described below:

- *Section 502: Complete Preemption*: Complete preemption is derived directly from the statute and comes into play when a participant attempts to bring a lawsuit based on state law against an ERISA plan where the subject matter of the claim is within the scope of ERISA's enforcement provision. The state law claim is "completely preempted," and the case is moved from state court to federal court. For example, a lawsuit based on the denial of a benefit is completely preempted and will be removed from state court to federal court.
- *Section 514: Conflict Preemption*: Conflict preemption, derived from U.S. Supreme Court decisions, is at issue when states try to regulate health care and their efforts affect ERISA plans. The provisions of Section 514 of ERISA indicate Congress' intent to have a uniform body of laws in order to minimize the burdens of employers' having to comply with conflicting directives from state to state.

The preemption provisions found in Section 514 are often referred to as the "preemption clause," the "saving clause," and the "deemer clause." The preemption clause, Section 514(a), is written broadly and provides that ERISA "supersedes any and all state laws insofar as they…relate to any employee benefit plan." The phrase "relate to" has been interpreted broadly to include state laws that have a connection or reference to an employee benefit plan. The saving clause, Section 514(b)(2)(A), limits this ERISA preemption stating that "any law of any state which regulates insurance" is "saved" from preemption. However, the deemer clause, Section 514(b)(2)(B), limits the saving clause, stating that an employee benefit plan may not "be deemed to be an insurance company…or to be engaged in the business of insurance." Since employee benefit plans may not be deemed to be

insurers, and therefore are subject to the preemption clause, large employers may escape state regulation by self-insuring (accumulating funds for health care) rather than purchasing insurance from state-regulated insurance companies. Of 163 million employees and dependents with employer-based health plans, 127 million are covered by ERISA plans, which can be divided into two groups. Seventy-two million employees and dependents are covered by ERISA plans that purchase insurance that follows state insurance law but are not subject to liability. Fifty-five million employees and dependents have ERISA plans that escape all state regulation.

ERISA's limited remedies and its preemption of state remedies made it difficult to deal with ERISA's negative effects in the health-care system and the provision of health care. As discussed in the next sections, states and patients have tried to use the courts to deal with the perceived inequities and barriers to health care, e.g., denial of benefits. These court cases have included issues involving attempts to tax ERISA plans, to limit the denial of benefits, to identify vicarious liability, and to challenge conflicts of interest that may exist.

SIGNIFICANT COURT CASES DEALING WITH ERISA AND HEALTH CARE

ERISA must be understood in the context of market forces. A discussion of the increasing cost of health care in the 1960s and 1970s and the problems faced by U.S. corporations that had to compete in a world economy against foreign industries that had a lesser health-care burden is beyond the scope of this chapter. However, it is important to note that managed care was seen as the answer to containing health-care costs, even if it meant decreasing coverage and lowering the standard of care. ERISA, as it turned out, would allow this to happen beyond the control of state laws and without risk of liability (Stone 1995).

Taxing ERISA plans

Some states have attempted to regulate health care through taxation. Of special note is the case *New York State Conference of Blue Cross and Blue Shield Plans v. Travelers Insurance Company*, which was decided by the U.S. Supreme Court in 1995. In the circumstances leading up to this case, New York State had imposed a scheme of variable surcharges on hospital bills. Commercial insurers and private insurers, including self-insured plans, other than the Blue Cross Blue Shield plans, were assessed a surcharge of 13% of the hospital bill. The proceeds from this tax were kept by the treating hospital. A further 11% surcharge was imposed and turned over to the state's general fund. In addition, health maintenance organizations (HMOs) were assessed up to a 9% surcharge, based on the number of Medicaid patients enrolled, and were to pay this amount to the state's general fund. The Blue Cross Blue Shield plans were exempted from these surcharges because their open enrollment policies resulted in their having higher medical costs than commercial insurers. Through this system of surcharges, New York was shoring up the Blue Cross Blue Shield plans, thereby assuring that through the Blues open enrollment, marginal and high-risk individuals would be able to obtain health insurance. HMOs were encouraged to enroll Medicaid recipients at lower costs to the state. Finally, the revenues retained by the hospitals allowed them to shift the costs of care of uninsured or underinsured patients to commercial insurers and HMOs.

Justice Souter, writing for a unanimous court in *Travelers*, stated that the surcharges do not "relate to" employee benefit plans within the meaning of ERISA's preemption provision and, therefore, are not preempted by ERISA. The surcharges made the Blues less unattractive as an insurance alternative and, therefore, had an indirect economic effect on choices made by buyers. The Supreme Court acknowledged that it is possible a state law might have such an acute economic effect, even though its effect was indirect, so as to effectively force an ERISA plan to adopt certain substantive coverage or effectively restrict its choice of insurers, which would lead to the state law being preempted under Section 514. However, the court held that New York State's statutory surcharges did not force substantive coverage or restrict the choice of insurers. Instead, the court found that the surcharges merely indirectly affected the relative price of insurance policies, which is no different from many state laws in areas that have traditionally been subject to local regulation which Congress could not have intended to eliminate through ERISA.

ERISA preemption litigation suits

Suits against ERISA plans asserting that decisions to limit care or to deny benefits directly harmed the plaintiff have failed. To illustrate this point, in *Corcoran v. United Healthcare, Inc.* (1992), the plaintiffs brought a state law malpractice claim against an ERISA plan alleging that negligent utilization review resulted in the death of their unborn child. During Florence Corcoran's first pregnancy, she was put on bedrest and fetal monitoring. When fetal distress occurred, a Caesarean section was performed, and her child survived. After Mrs. Corcoran became pregnant again, her obstetrician recommended complete bedrest and, later in the pregnancy, ordered hospitalization of Mrs. Corcoran so that the fetus could be monitored around the clock. However, her ERISA plan had instituted managed care utilization review since her previous pregnancy. While her same obstetrician recommended the same bedrest and fetal monitoring, United Healthcare ("United") determined that hospitalization was not necessary and instead authorized the less expensive 10 hours per day of home nursing care. Mrs. Corcoran was hospitalized from October 3–12, 1989, but, because United had not precertified her stay, she returned home. On October 25, 1989, when the home care nurse was not on duty, the fetus went into distress and died.

In *Corcoran*, the U.S. Court of Appeals, Fifth Circuit, noted that although United did indeed make medical decisions and give medical advice, "it does so in the context of making a determination about the availability of benefits under the plan." Thus, the court ruled that Section 514 of ERISA preempted a state court malpractice action, and Section 502 of ERISA did not compensate a plaintiff for damages. The plaintiffs, who alleged that coverage decisions were wrongly made, were limited to recovery of their contractual benefits as provided in Section 502 and therefore were not permitted damages for emotional distress.

Theory of vicarious liability and managed care entities

There have been many attempts to sue managed-care entities on the basis of state law theories of vicarious liability. The doctrine of "ostensible agency" has been a part of vicarious liability in many jurisdictions; this doctrine imposes liability if a reasonable person would conclude that the clinician is an employee or agent of the health-care facility even if he or she is not. For example, health-care plans that direct patients to a list of preferred providers are closed panel HMOs and presumably would meet the requirements for vicarious liability in many states.

In *Dukes v. U.S. Healthcare* (1995), the U.S. Court of Appeals, Third Circuit, ruled that a vicarious liability action against an HMO did not fall within the scope of Section 502 of ERISA. The *Dukes* case was a consolidation of two cases filed in state court against HMOs organized by U.S. Healthcare. Each of the two consolidated cases alleged medical malpractice of HMO-affiliated hospitals and medical personnel. In the *Dukes* case, Darryl Dukes' primary care physician discovered a problem with Mr. Dukes' ears. Surgery was performed and Mr. Dukes was given a prescription for blood studies. However, when Mr. Dukes gave the prescription to the hospital's laboratory, the hospital refused to perform the blood studies for a reason not discussed in the record.

The following day, Mr. Dukes saw another physician who also ordered a blood test, which was performed. However, Mr. Dukes' condition continued to worsen, and he died. At the time of his death, Mr. Dukes' blood sugar level was very high—a condition that allegedly would have been found through a timely blood test.

Mr. Dukes' wife brought suit in state court alleging medical malpractice, among other claims. The HMO removed the case to federal court based on the HMO's being part of an ERISA plan, and the theory that Mrs. Dukes' claims "relate to" a welfare plan and are therefore preempted under Section 514 of ERISA. Mrs. Dukes moved that the case be remanded to state court, and the HMO moved that it be dismissed. The district court dismissed Mrs. Dukes' claims against the HMO and remanded to state court the claims against other defendants that Mrs. Dukes had brought.

The Third Circuit found that there was "no claim that the plans erroneously withheld benefits." The *Dukes*' court noted "the plaintiffs…complain about the low quality of the medical treatment that they actually received and argued that U.S. Health Care HMO should be held liable under agency and negligence principles." Yet, Congress did not create ERISA Section 502 as a remedy for medical malpractice. The net result of *Dukes* was that the Third Circuit returned the lawsuit to state court for trial. However, the Third Circuit did not reach the question of whether Section 514 of ERISA would preempt the malpractice actions in the state courts. The *Dukes* case was ultimately settled out of court.

ERISA fiduciary duties

As stated above, ERISA does not protect from liability doctors or hospitals that provide care to patients. ERISA insulates from liability those who make benefit determinations even when they depart from accepted medical standards of care. *Pegram v. Herdrich* (1999) deals with the application of ERISA fiduciary duties to HMO decisions about what care is needed and, therefore, what will be paid for.

In March 1991, Cynthia Herdrich, a part-time legal secretary, experienced pain in her lower abdomen that she thought might be appendicitis. She went to see Dr. Lori Pegram, a physician at her managed-care HMO, Carle Care in Bloomington, Illinois. Six days later, Dr. Pegram identified a 6 × 8 centimeter inflamed mass in Herdrich's abdomen. Dr. Pegram did not order an ultrasound at a local hospital, but instead referred Herdrich to a facility staffed by Carle Care, which was more than 50 miles away and could not perform the ultrasound for 8 days. Before the 8 days elapsed, Herdrich's appendix ruptured causing peritonitis that required emergency surgery.

Herdrich sued Dr. Pegram and Carle Care in state court for medical malpractice, and charged that the tests were delayed because the plan's doctors had financial incentives to hold costs down. Carle Care was providing health-care services as part of an ERISA plan. Carle Care and Dr. Pegram asserted that ERISA preempted the two counts of state law fraud and moved the case to federal court. Herdrich alleged that provision of medical services under the terms of the Carle Care HMO—rewarding its physician owners for limiting medical care—entailed a breach of its ERISA fiduciary duty, because these terms created an incentive to make decisions in the physicians' self-interest rather than the exclusive interest of plan participants.

The original malpractice counts were tried by a jury in state court, and Ms. Herdrich prevailed on both, receiving a total of $35,000 in damages. A Federal District Court rejected her ERISA claim that the HMO had breached its fiduciary duty. A three-judge panel of the U.S. Court of Appeals for the Seventh Circuit voted two to one that when

HMO physicians delay providing needed medical treatment to increase their bonus, they may breach a fiduciary duty, an impermissible conflict of interest. The full Appeals Court declined to review the three-judge panel's ruling. The refusal to review the decision *en banc* was appealed to the U.S. Supreme Court. The U.S. Supreme Court granted *certiori*.

The *Pegram* suit challenged the common type of "mixed" eligibility determination. Mixed eligibility decisions are those that involve elements of both "eligibility decisions" (whether the ERISA plan covers a particular condition or course of treatment) and "treatment decisions" (the appropriate medical response to the patient's condition).

With this important health-care case—one that could have a direct effect on the provision of care to psychiatric patients—coming before the U.S. Supreme Court, the American Psychiatric Association (APA) decided to write an amicus brief. The APA reviewed the trade-off between ERISA coverage and state law coverage. In general, if a particular matter is subject to ERISA, then it is not subject to state law; however, liability under state law (with damages) provides a stronger remedy, because ERISA damages only allow recovery of the cost of the denied benefit.

The APA brief stressed two points: (a) the real harm that can be caused by certain kinds of incentives to withhold or delay or re-direct treatment; and (b) the need for such incentives to be subject to the same legal coverage whether under ERISA or state law. The theme of the amicus brief was that if state law does not apply, then ERISA must apply so that no gap in legal coverage results.

The Supreme Court heard oral argument on the case in February 2000 and issued its opinion in June 2000. The Supreme Court held unanimously in favor of the HMO. Justice Souter wrote, "no HMO organization could survive without some incentive connecting physician reward with treatment rationing." The Supreme Court held that ERISA duties do not apply to the decisions challenged, because Congress did not mean for mixed determinations to be ERISA fiduciary decisions. The Supreme Court did not say, however, what limits, if any, there are on the application of state law to HMO structures and the harm caused by the mixed determinations made by ERISA plans. This critical issue will now be played out in the state courts.

Rather than resulting in a major setback for those trying to hold managed care accountable for its mistreatment of patients, *Pegram* contained language that some viewed as potentially helpful to patients. The Supreme Court's opinion in *Pegram* indicated that it does not believe that Congress, in passing ERISA, ever intended to supplant state medical malpractice laws. But *Pegram* did not address the accountability issue, and it may have opened the door to state courts holding managed care companies accountable for their negligent medical necessity determinations.

SUMMARY

When ERISA was passed to protect employee pensions and benefits, few, if any, could have foreseen that ERISA preemption and limited remedies would allow managed care companies to reduce professional standards of care while protecting the managed care company from liability. It is ironic that a law passed to protect the rights of employees has been used to deny patients who have been damaged appropriate recourse, and encourages managed care companies to deny care, confident that they are legally beyond reach.

SUMMARY KEY POINTS

- ERISA's primary purpose was to provide a scheme for the protection of employee pension funds. All employee benefit plans, including healthcare, were added as an afterthought.
- ERISA does not provide a remedy for beneficiaries who are harmed by prospective denial of benefits.
- ERISA does provide limited remedies but usually preempts state claims for damages with Section 502 describing complete preemption and Section 514 describing conflict preemption.
- Attempts to tax ERISA plans have met with limited success, *Blue Cross and Blue Shield Plans v. Travelers* (1995).
- ERISA does not shield doctors or hospitals from malpractice liability.
- In *Pegram v. Herdrich* (1999) the Supreme Court held that ERISA duties do not apply to "mixed" eligibility determinations, i.e., decisions that involve deciding if the ERISA plan covers the treatment and if the treatment is appropriate for the patient.

Law and justice are not always the same.

Gloria Steinem

INTRODUCTION

Since Stone called into question the ethical boundaries of forensic psychiatry (Stone 1984), a number of leaders in the field have drawn on the principles of moral philosophy (the branch of philosophy concerned with ethical theories) to conceptualize and implement ethical guidelines and operational principles; in the process, an ethical framework for forensic psychiatry has gradually evolved (Appelbaum 1997). Although few of our colleagues are as knowledgeable in philosophical matters as Stone and Appelbaum, nonetheless, an appreciation of the basic concepts of legal philosophy will serve to enhance every forensic psychiatrist's understanding of the history, development, and purposes of the legal institutions and practices that operate at the interface between psychiatry and the law. This process of exploring and charting the *terra incognita* of the law is bound to promote a greater degree of intellectual stimulation and satisfaction for the forensic practitioner, who applies psychiatric expertise to a rather specialized set of issues within the context of a system whose conventions and procedures may seem alien and mysterious to the nonlawyer.

WHAT IS LAW?

The philosophy of law applies the discipline of philosophy to study the issues raised by the existence, nature, and practice of law. This basic overview of the subject is intended as an introduction for the forensic psychiatrist and does not begin to address the full scope of legal philosophy dating back "twenty-four hundred years—from the Greek thinkers of the fifth century BC, who asked whether right was right by nature or only by enactment and convention, to the social philosophers of today, who expound on the ends, the ethical basis, and the enduring principles of social control" (Pound 1954). The quintessence of legal philosophy, simply stated, is "What is law?" The first step in studying this question involves analyzing the socio-cultural antecedents in pre-legal societies of the rules and regulations from which law originates. Before formal rules or laws had been enunciated and certain individuals were accorded privileged status in the community (e.g., as "judges" of others), even the most primitive societies had norms that evolved from the particular needs of that society. For example, on the most simplistic level, it is apparent that *revenge* played a major role in creating the norms in early societies. The instinct of an aggrieved or injured party to take revenge and the evolution of social conventions to control the expression of that instinct served as the basis of customary norms that underlie the civil and criminal law of more complex societies. With more complex interrelationships among the people in a community, norms developed and resulted in codifications in law, regulations, and systematized mechanisms, such as courts, judges, and juries, for resolving conflicts (Elliott 1985).

Golding (1975) set forth a lucid and concise analysis of the elements of a legal system within any society. He addressed

the question of what it means to say that a legal system exists in society (any given society). Golding proposed that the statement that a legal system exists in society is true if

1. There are laws in society.
2. There exists in society an agency for making and changing the laws.
3. There exists in society an agency for determining infractions of the laws.
4. There exists in society an agency for enforcing the laws.
5. There exists in society an agency for settling disputes between individuals.

These five conditions set forth the general conditions for all legal systems. The first condition—that is, the existence of laws—is a necessary element of any society that claims to have a legal system, because it is inconceivable to have a "lawless" legal system. Golding classified conditions (2) through (5) as *jural agencies* and reached the conclusion that a society possesses a sufficient degree of what he terms *jural complexity* to permit us to assert that it has an actual legal system, if it has both a set of laws and any two of the four enumerated *jural agencies*. *Jural agencies* are viewed in terms of the type of *jural activities* they perform. In the course of analyzing these terms and concepts, Golding offered an example based on the major role of revenge in creating the norms in early societies, which was alluded to above:

> Suppose that we come across two separate cases of one man killing another. Suppose further that in all behavioral and psychological respects the two acts are perfectly alike: each actor, with venom in his heart, kills his enemy with a sword. Now, it does not follow that there can be no difference between the two cases; in fact, one is a pure case of murder, while the other is not. This is possible because one of the killers (the latter) is the state executioner who is carrying out the sentence of a court. His act is the act of an *official*—he is a jural agent—acting in an official capacity, and it is an instance of a jural activity. (Golding 1975, 22)

Jural agents have an authoritative status within a society to carry out appropriate jural activities (e.g., settling a dispute, making or changing a law, or enforcing a law). Laws of competence (or power-delegating laws) regulate and establish when a particular jural agent is acting in an appropriate official capacity. The *authoritative* status of a society's jural agencies and the jural acts they perform derive from certain characteristics or qualities inherent in its laws: its laws are perceived as *valid* both behaviorally and psychologically (i.e., most members of the society conform their behavior to the rules or laws most of the time and view them as normative guides to action). Laws are binding on a society (1) when they are enforced (by sanctions), (2) when they are recognized as binding because they are legitimate (i.e., enacted in accordance with the formal procedures that have been established for making laws in the society), and (3) when they are perceived as imposing a moral obligation or duty to obey them.

THEORIES OF LAW

It is a truism that law serves as a device for social control; yet law differs from other methods of social control, for example, mere force or morality (Murphy and Coleman 1990). The forensic psychiatrist should be familiar with the two main traditions in legal philosophy, Natural Law and Legal Positivism.

NATURAL LAW

According to the theory of Natural Law, legal validity requires a corresponding moral validity as an absolute logical and conceptual prerequisite. At the very least, laws must be morally permissible. The classical version of natural law theory dates far back to the ancient Greeks and their doctrine of the *Logos,* i.e., the invisible pattern or principle that governs the transactions of the cosmic order. In *Summa Theologiae*, St. Thomas Aquinas emphasized the essence of natural law theory:

> As Augustine says, that which is not just seems to be no law at all. Hence the force of a law depends on the extent of its justice…Every human law has just so much of the nature of law as it is derived from the law of nature. But if at any point it departs from the law of nature, it is no longer a law, but a perversion of law. (Aquinas 1954, 784)

According to Aquinas, natural law is the "participation of the eternal law (i.e., the Divine law for the governance of the universe) in the rational creature" (Aquinas 1954, 787). Lawmaking is grounded on reason in order to promote the common good of the community. One is obligated to obey the law (which has a coercive force, backed up by sanctions) not because of the threat of force, but only under circumstances when the content per se of the law is itself moral. The eternal verities of the moral order, expressed as a part of the order of nature in the view of medieval Christian theology, provide the rationale for laws and their attendant legal obligations.

Contemporary legal philosophers have carried on the tradition of natural law theory, albeit reformulated in the more acceptable idiom of our own age, divested of the metaphysical and theological trappings of the classical natural law system of Aquinas. Hart (1961) articulates a "minimum content" theory of natural law, which he views as the "core of good

sense" in natural law theory. Hart believes that because society is concerned with the survival in proximity of its members (it is not a "suicide club"), natural law provides a meeting ground for the minimal overlap between morality and law that serves this aim. The nature of the *human condition* (e.g., that humans are vulnerable to harm, limited in their powers of self-control and foresight, limited in their altruism, and by necessity attempting to cooperate in order to survive in a world of scarce, limited resources) mandates that the major social institutions of law and morality will overlap somewhat in dealing with these basic human concerns.

Fuller (1964) has written about legal systems and the central importance of "the internal morality of the law." In order to qualify as a legitimate legal system, the overwhelming majority of its rules must be seen to satisfy procedural demands of a moral nature, compatible with justice and fairness, for example, treating "like cases *like*," not applying rules after the fact, giving fair notice, and impartially enforcing the rules. Fuller wrote extensively about the legal pathology inherent in Nazi Germany, where the entire system of secret, arbitrary laws, based on the whims of those in power, failed to meet the minimal standards of morality that make law possible. Fuller's approach focuses on the moral requirements of formal legal *procedure* only, and imposes no moral limitations on the *content* of laws.

Dworkin (1977) advanced a theory of judicial decision making, the "rights thesis," which stands for the proposition that principled judicial action involves a search for the right answer to the question "who has the right to win?" Protection of rights that are based on the moral values of our legal order would outweigh utilitarian considerations of policy or the collective welfare. In arguing that Japanese Americans had a *right* not to be interned after the attack on Pearl Harbor, Dworkin writes:

> Individual rights are political trumps held by individuals. Individuals have rights when, for some reason, a collective goal is not a sufficient justification for imposing some loss or injury upon them. (Dworkin 1977, xi)

LEGAL POSITIVISM

Legal Positivism derives its name from the fact that law is *posited* by human authority. The compendium of Roman law compiled by order of the Emperor Justinian I in the sixth century captured the concept of Legal Positivism in admirably pithy terms: "What pleases the Prince has the force of law." John Austin, the nineteenth century English legal philosopher, is generally regarded as the Father of Legal Positivism. Austin rejected Natural Law theory and its essential connection between law and morality. He held that the existence of law is one thing; its merit or demerit is another (Austin 1954). Austin's theory of law is often referred to as the *Command* theory. The *command of the sovereign* (or supreme political authority) constitutes the law governing a given society. The sovereign is defined as that individual (or group) who receives the obeisance of the society on a habitual basis and who in turn is not in the habit of obeying others in the society. Once a law has the *imprimatur of the sovereign*, indicating the will or desire to be obeyed, there is a nonoptional condition imposed in the form of a legal duty or obligation. The law is a coercive device for social control, a "command backed by a threat" to enforce compliance (whether or not the threatened sanction is actually carried out). Punitive sanctions, in the criminal law, entail punishment by the appropriate jural agency. Privative sanctions, in the civil law, deprive the individual of the state's jural enforcement authority (regarding transactions such as making a will) if he or she fails to follow the relevant legal rules. The *command of the sovereign* is the legitimate law of the society in question. The pedigree test for legal validity, according to Austin, is simply that the law's enactment can be traced to the sovereign whose actions define legality for that society.

Hart (1961) significantly refines Austin's "command-of-the-sovereign" model of the law by emphasizing the importance of overall legal systems and legal rules (e.g., a pedigree test that defines legal validity for a particular society by specifying that laws must be enacted according to agreed-upon rules for generating binding laws). Hart further distinguishes between *primary rules*, which are the rules that impose legal duties and obligations on individuals, and *secondary rules*, which are "rules about rules." The secondary rules involve the primary rules themselves, how to recognize them (i.e., how to determine if they possess the proper pedigree to constitute a valid law); how to initiate, modify, or repeal them altogether (e.g., by establishment of legislatures); how to determine conclusively whether they have been violated; and how to settle legal disputes (e.g., through the establishment of courts and rules of adjudication). A succinct statement of Hart's theory of the law is that "Law [is best regarded] as a system of primary and secondary rules" (Hart 1961, l07). Many regard Hart's work as the definitive exposition of the basic philosophical question, "What is law?"—essentially settling the issue once and for all. Others, including adherents of Legal Realism and Critical Legal Studies, criticize Hart for achieving uniformity at the price of distortion (Twining 1973; Unger 1986).

SOCIAL CONSTRUCTION OF LAW AND PSYCHIATRY

Several contemporary issues at the interface between jurisprudence, social science, and the mental health professions are worthy of the forensic practitioner's attention. The continuing controversy between Natural Law theory and Legal Positivism is reflected in similar debates regarding the "natural" status versus social construction of mental illness (Schaffner and Tabb 2014). Each of these debates is embedded in broader philosophical questions regarding the nature of ethics and morality and, especially, the problem posed

by philosophical relativists and ethical emotivists who hold that values and morality are themselves individually or communally subjective (Wilks 2002). This issue is in effect duplicated within psychiatry itself, where it has been argued that the entire mental health profession, with its focus upon *evaluating* mental health, intelligence, adaptation, identity, insight, reality testing, interpersonal relations, and various other psychological functions, is itself value laden. On what basis are such evaluations made? Are they grounded in trans-temporal and trans-cultural "science," or do they simply reflect the current attitudes of the community or mental health professions. Given these complexities, the forensic psychiatrist cannot uncritically cloak himself or herself in a veneer of "scientific objectivity." How to recognize the place of values within the mental health professions without losing scientific perspective on "truth" is itself a profound philosophical challenge for both the courts and the forensic specialist (Appelbaum 1997).

FREE WILL, DETERMINISM, AND CRIMINAL RESPONSIBILITY

One significant jurisprudential issue that can result in a conflict between the values of the law and the forensic specialist's understanding of human behavior arises in connection with conceptualizations of human agency and the determinants of an individual's behavior. The issue of the place of free will in law and ethics is at least as old as Kant, who noted that the demands of morality and ethics, which assume the possibility of freely chosen, responsible action, conflict with the tenets of natural science, which assumes that all events, including all human behavior, are a function of a chain of antecedent causes. The problem has not gone unnoticed in the recent literature on jurisprudence, which has raised questions regarding the "myth of free will" in the criminal law. Matthew Jones (2002), for example, has argued that the law has always assumed that an individual has the capacity to freely choose between behavioral alternatives. Jones has pointed to the fact that the Supreme Court explicitly acknowledged this axiom by stating that a "belief in freedom of the human will [is] universal and persistent in mature systems of law" (*Morissette v. United States* 1952). This *legal fiction* that has direct bearing on both the notion of criminal responsibility and the rationale for punishment, has been directly challenged by social scientists. For example, the neuropsychologist Sam Harris has argued that both the belief in and the subjective experience of free will is an illusion and that the rationale for holding criminal defendants "responsible" and "punishing" them for their actions rests upon an outmoded, pre-scientific mindset. According to Harris (2015), if we examine our own experience closely, we realize that everything we think of, feel, and intend simply arises from an unconscious source and is in no way dependent on our own will and decision. This proposition, which has received (albeit controversial) support in the experimental literature (Libet et al. 1999) accords with the basic scientific principle of universal causality and is in opposition to the assumptions of virtually all systems of ethics and law. As Jones points out, the future of criminal law will in many ways be impacted by scientific findings that strongly suggest that human behavior has genetic and environmental causes that place limits on the presumed free, responsible human subject. Courts and forensic specialists may, in effect, adopt a form of *philosophical compatibilism* (Dennett 2003), which regards those actions as free that are compatible with an individual's desires and therefore not obviously "compelled." However, the problem remains, for example, with respect to offenses such as pedophilia, regarding the origins of one's desires, which few would argue are freely chosen. Jurisprudentially, the question is whether courts, with the prodding of the social science and mental health fields, will expand their conception of behaviors that are regarded as ill or dysfunctional, as opposed to criminal, and adjust sanctions accordingly. While some have called for such reform, others, such as Jones, have argued that the criminal law is flexible enough to retain its current conceptions of punishment by changing from a punitive to a more utilitarian rationale for its implementation.

PSYCHOLOGICAL JURISPRUDENCE

Darley and colleagues (2002) have argued that a field of "Psychological Jurisprudence" can aid the law in securing the public's acceptance of and compliance with law and judicial decisions, as well as alter the behavior of those who have previously failed to comply with legal requirements. Others (Birgden 2004) have called for a "Therapeutic Jurisprudence" that will employ psychological principles to motivate offenders to refrain from future criminal acts and participate in rehabilitation. Such authors have argued that the law can greatly benefit from a "conception of the person [that is] based upon research about people's motivation, cognition, and decision-making" (Darley et al. 2002, 37). Darley et al. criticize the deterrence model of criminal sanctions on the grounds that at least for certain offenses an individual's estimate of the likelihood of being apprehended and punished has little impact on his or her behavior. Laws, they argue, must be adjusted to be commensurate with human motivation, so that the vast majority of individuals feel motivated to comply with the law regardless of any governmental sanction or punishment. When laws (e.g., those prohibiting the sale and possession of substances like marijuana) do not accord with such motivations, a legal and social crisis ensues. This analysis, of course, raises the question of the relativity of values—whether law can or should be subject to presumed "natural" or objective values, or should simply reflect the consensus of the people who are subject to its sanctions.

FEMINIST JURISPRUDENCE

The values, rights, and modes of thought of previously suppressed or "different" (Minow 1991) segments of the

population raise a variety of issues and problems for the law. Contemporary feminist jurisprudence, for example, involves both a broad-ranging critique of the foundations of legal thought and a focus on specific substantive issues that have limited the rights, freedom, and economic status of women in the eyes of law and society.

Feminist jurisprudence is quite varied in its outlook, and several models have emerged; these include the *liberal mo*del, which focuses on equal rights and the effort to assure that women attain meaningful equality; the *dominance model*, which critiques existing models of law on the grounds that they are vehicles to extend practices of male domination; and the *difference* model, which holds that equal treatment under the law is only achieved when differences between the sexes are recognized and taken into account. Each model, however, appeals to (and at times critiques) certain fundamental moral or axiological principles, such as the equality of all human beings, and seeks to rectify those situations where the law unjustly deviates from (or in some instances *should* deviate from) these principles (Francis and Smith 2015). In addition, feminist critics argue that certain established *legal principles*, such as adherence to legal precedent, have the effect of maintaining and legitimizing a status quo in which women and other minorities are diminished in worth, status, and power.

An important issue for feminist jurisprudence relates to the real and purported differences between the sexes. For example, it has been argued that because women become pregnant and bear children, simple "equality under the law" can effectively result in gender discrimination in which women are denied jobs and economic advancement. This occurs, for example, when the law does not grant rights for family, pregnancy leave, and part-time employment (Minow 1991). It is argued that simple "equal treatment under the law" in such cases effectively results in gender discrimination. Such "equal treatment," it is said, is only equal under a patriarchal, male-dominated conception of legal justice.

According to some feminist thinkers, a further (and conservative) implication of gender difference is that aspects of a patriarchal or at least "paternalistic" jurisprudence may need to be retained, in order to achieve social and economic equality for women. These thinkers have raised questions regarding the dismantling of "protectionist" laws, e.g., alimony and child support, which have been limited under the rubric of "gender equality," but which may actually contribute to what has been termed the "feminization of poverty" (Francis and Smith 2015).

Another important jurisprudential issue for feminist thinkers involves the distinction between public and private domains. Typically, the latter is regarded as largely outside the law's reach. An important question relates to the state's interest in "voluntary" behavior within private economic arrangements that involve the human body. Questions regarding "voluntary and consensual prostitution" and participation and distribution of gender-oppressive pornography exemplify this issue. With regard to prostitution, for example, no single "feminist" voice has emerged; liberal feminists advocate its legalization, while "dominance" feminists argue that it is essentially repressive (Hung 1999). Feminist scholars have also raised questions regarding whether the law should permit women to engage in paid surrogate pregnancies and gamete donation; some have argued that doing so legitimizes power inequalities within which women cannot effectively act voluntarily (Andrews 1988).

The question of public versus private domains also arises in connection with marriage and cohabitation situations in which women are physically, emotionally, or economically abused in a manner that would never be tolerated within a public arena. Women living in "traditional" marriage or other "consensual" co-habitation arrangements, in which they are not paid for domestic work and child-rearing, may continue to be subject to such abuse in a manner that is beyond the reach of the law (Dempsey 2009). Of particular interest to mental health professionals is the feminist critique of the family therapy model of domestic abuse, which tends to view such abuse exclusively as an individual or family problem, rather than a social and legal one as well (Hansen and Harway 1993).

Feminists are also concerned with issues relating to the subtle and often unrecognized infiltration of traditional religious notions into the legal arena. This, they argue, has long been evident in efforts to restrict the scope of *Roe v. Wade* (1973) and more recently in arguments over the Defense of Marriage Act and gay marriage. While many feminists recognize that the question of abortion, for example, raises deep moral questions and conflicts, they argue that these conflicts must be balanced against a woman's right to control her own body and destiny and should not, on the principle of the separation of church and state, be dictated by religious notions of "life" and "personhood" (Francis and Smith 2015).

Foundations of American law: The court system and the legislative process

ROBERT LLOYD GOLDSTEIN

INTRODUCTION

The common law is a distinctive legal system that originated in medieval England, grew and developed in the courts of the king, and during the twelfth and thirteenth centuries came to be applied throughout the English realm. Hogue (1985) distinguishes it from other legal systems of that period (e.g., local customary law, canon law administered by church courts, rules of feudal custom applied by courts of baronial overlords) "by calling it simply the body of rules prescribing social conduct and justiciable in the royal courts of England" (Hogue 1985, 5). In time, three royal courts (three superior courts of common law) emerged: the Court of Exchequer (with jurisdiction over controversies pertaining to the king's property and revenue), the Court of King's Bench (with jurisdiction over criminal cases and civil cases involving a breach of the peace), and the Court of Common Pleas (with jurisdiction over all other civil disputes between the king's subjects).

In addition, there was another system, rivaling that of the common law, which also originated in the Middle Ages: the Court of Chancery, which exercised jurisdiction over suits in equity. Judges in equity, originally ecclesiastical dignitaries, intervened to correct the harshness or inflexibility of the common law on grounds of morality or conscience (Scott and Kent 1967). An excellent exposition of the origins, development, and complexities of the common law, which does not assume professional legal training, can be found in the slim volume *Origins of the Common Law* (Hogue 1985). The reception of the common law of England in the United States was characterized by a process of selective adoption, providing for the continuity of English and American legal principles, but transforming them for American use by specific legislative enactment or judicial decision. In other words, the principles of English common law were drawn on as sources of guidance, but did not always find acceptance. As Justice Story said in a leading case:

> The common law of England is not to be taken in all respects to be that of America. Our ancestors brought with them its general principles, and claimed it as their birthright; but they brought with them and adopted only that portion which was applicable to their condition. (*Van Ness v. Pacard* 1829)

The most prominent characteristic of early American law was the strong tendency toward codification. Although the common law served as a fundamental subsidiary law, there was a paucity of lawyers trained in the English tradition and few law books available to transmit the corpus of English common law doctrine. Historically, this was the pragmatic basis for the adoption of elaborate and rather complete codes of law, which constituted most of the law under which the American colonists lived (Walsh 1932). A century ago, case law was the dominant ingredient in American law, and legislation was of lesser importance. Today, with the enormous growth of the federal regulatory agencies and the tendency toward comprehensive law codification (e.g., the Uniform Commercial Code), "legislation has fully come of age as a form of American law" (Jones et al. 1980, 3).

The following sections outline the present-day organization of the American court system (at both the federal and state levels), the nature and authority of case law, and the legislative process. Finally, the meeting ground is examined where case law and legislation come together—that is, statutory interpretation and construction by the courts.

The organization of court systems in the United States is rather complex and reflects the historical realities of our federal system of government. There is a dual system of state and federal courts, each with its own system of legal doctrine and practices. However, to complicate matters further, each system of courts is routinely called on to confront and decide issues of law originating within the other system. For example, federal issues regularly come to the fore in state trials

(e.g., the exclusionary rule in a state criminal proceeding) and are decided by the state court in accord with guiding federal precedents. Conversely, lawsuits governed by state law are often brought in federal courts (under "diversity" jurisdiction) and then the federal trial court will generally be bound to apply state substantive law in the case before it (although it will continue to follow federal procedural law).

FEDERAL COURTS

Article III of the Constitution provides, in pertinent part, as follows:

> Article III, Section 2. The judicial Power of the United States shall be vested in one Supreme Court and in such inferior Courts as the Congress may from time to time ordain and establish.

Thus, the Supreme Court is the only federal court directly created by the Constitution. Congress has the power to create, modify, abolish, and establish the composition and jurisdiction of all other federal courts.

The Supreme Court is the court of last resort for the federal system and, in cases containing federal questions, for the state judicial systems as well. It has broad discretion to refuse to hear the vast majority of cases for which review is sought. The court must be persuaded that the issues involved in the case are sufficiently important, as questions of federal law that must be decided with finality, to grant *certiorari* for hearing and decision on the merits. The Supreme Court is nothing less than the "umpire of the federal system, authoritative guardian of constitutional liberties and final overseer of the consistency and substantial justice of the general law administered in the courts of the United States" (Jones et al. 1980, 48). While the Constitution does not expressly give the Supreme Court the power to determine the constitutionality of acts of Congress or state legislation, the court itself, in a series of opinions, held that it had the power to review and invalidate federal and state legislation it determines to be unconstitutional (*Marbury v. Madison* 1803; *Fletcher v. Peck* 1810).

Courts of appeals have final jurisdiction over all cases arising in the lower federal courts in their district or circuit (except those reviewed by the Supreme Court). There are 13 such circuits, 11 comprising geographical divisions among the states, a 12th for the District of Columbia, and a 13th that reviews cases from specialized federal courts (e.g., the Tax Court).

There are currently 91 district courts, at least one in every state, up to four in the more populous states. These are the major trial courts of the federal system and have jurisdiction over cases within the judicial power of the United States, as defined in the Constitution. Procedure in the district courts is uniform throughout the United States for civil and criminal cases. There are a number of special courts in addition to the foregoing, including the Court of Military Appeals, the Court of International Trade, the Tax Court, and the Court of Appeals for the Federal Circuit (created from the merger of the Court of Claims and the Court of Customs and Patent Appeals).

STATE COURTS

Each of the 50 states has its own system of courts, with a triple-layered hierarchical structure. At the bottom of the hierarchy are the "inferior" or "petty" trial courts, whose jurisdiction is limited to civil suits involving small amounts of money (e.g., small claims court) or minor criminal violations. At the next level are trial courts of general jurisdiction, usually referred to as superior courts. (New York State, confusingly, calls its trial courts of general jurisdiction the Supreme Court, which in most other states is the name given to the highest appellate court.) Their principal function is to hear civil and criminal cases generally. They are courts of record (i.e., detailed records of the proceedings are made), and their procedure is strictly formal. Specialized trial courts exist separately or are part of the trial court of general jurisdiction, for example, probate courts and family courts.

At the top of the judicial hierarchy are the appellate courts, which hear appeals from the judgments of the trial courts of general jurisdiction. These state courts of last resort are usually called the Supreme Court of the state but may have other names (e.g., Supreme Judicial Court, Court of Appeals). In over half of the states, there are intermediate appellate courts as well, which serve to screen out and make final authoritative disposition of the bulk of appellate litigation. This allows the highest appellate court broad discretion to focus on cases that raise novel, difficult, or socially important issues.

NATURE AND AUTHORITY OF CASE LAW

All systems of law employ case law to some extent, but it is especially authoritative and influential in a common law system such as our own. Case law has its origin in the judicial decisions judges reach in deciding disputes between particular parties. It is a "by-product of the ongoing process of settling particular controversies" (Jones et al. 1980, 3). Law exists in two authoritative forms, legislation and case law. How does dispute settlement of a particular case become a potential source of authoritative and generally applicable case law? The answer lies in the doctrine of *stare decisis* ("to stand by precedents and not to disturb settled points"). The doctrine declares that once a judicial decision settles a particular controversy or a disputed point of law, that decision becomes binding and will be followed in all subsequent factually similar cases. The authoritative force of precedent was firmly established at the dawn of the common law era in the royal courts of England. The meritorious features of this principle have been described as follows (Bodenheimer et al. 1980):

1. The doctrine of *stare decisis* enhances the social values of predictability, calculability, and certainty in the planning of private and business activities. Legal rights, duties, and obligations are relatively stable and ascertainable as a result.

2. Attorneys have a settled basis for legal reasoning and dispensing advice to clients, knowing that courts are generally bound by legal authority and precedent. The probable outcome of potential litigation may often be forecast and the total caseload of litigation may be presumably drastically diminished thereby.
3. Judges are forced to follow established precedents and thereby potential arbitrariness, favoritism, and bias are curbed. Otherwise, mere whims and idiosyncratic notions of right and wrong might be applied with the detrimental effect of erosion of public confidence in the integrity of the judiciary and loss of respect for the law. The public is more likely to accept judicial decisions as binding, in the knowledge that they are based on precedent, an objective body of law, and impartial reasoning free from bias or subjective concerns.
4. Following precedents promotes judicial efficiency and reduces the costs of litigation. Judges do not have to examine each legal issue *de novo* every time and each past decision need not be reopened in every case.
5. The doctrine of *stare decisis* is more consistent with a sense of justice, in that all individuals are more assured of being "treated alike in like circumstances." Order, stability, and continuity of the law satisfy our reasonable expectations that justice will be done.

Judicial decisions serve as precedents only within the same judicial system or jurisdiction: for example, a decision of New York's highest state court (the Court of Appeals) is binding precedent only in that court and in New York's lower courts. It has no binding authority for future cases adjudicated in the courts of New Jersey, California, or any other state system. Even decisions of the U.S. Supreme Court are not binding on state courts unless a federal question or constitutional interpretation was at issue. The higher a court stands in the hierarchy of its own jurisdiction, the greater force as precedent its decisions are accorded. (For example, decisions of the Supreme Court of California are binding on all lower California courts, whereas decisions of the intermediate appellate courts have much less precedential authority and are liable to be overruled at some future date by the higher tribunal. Subordinate courts must always adhere to precedents of higher courts with supervisory jurisdiction over them.)

American courts have never regarded the doctrine of *stare decisis* as absolutely binding, as have English courts until quite recently. Sometimes legal rules become antiquated or obsolete and innovation and responsiveness to social change call for the abandonment of an established precedent. In such cases, the highest courts have reserved the authority to overrule or set aside their own past decisions, when public policy considerations and the proper development of the law require a change. Courts do not lightly make use of their prerogative to overrule their own clear precedents. Generally they agree with Cardozo that "adherence to precedent should be the rule and not the exception" (Bodenheimer et al. 1980, 68).

LEGISLATION

Legislation, as a source of the law, has been compared to a proverb, while case law has been likened to a parable. The latter is composed of principles inferred from decisions handed down in particular cases that decided concrete disputes between parties. The former is an authoritative, prescribed general rule, promulgated by a lawmaking body. According to Patterson,

> A proposition of case law may be correctly stated in several different ways, each of which is equally official. A statute (proposition of legislation) is stated as an exclusive official wording of the rule. Case law is flexible; legislation is (textually) rigid. (Jones et al. 1980, 12)

In the United States, the Constitution of 1789, in Article 1, Section 1, created a bicameral legislature, the Congress of the United States, composed of the Senate and the House of Representatives. All legislative powers of the federal government are conferred on the Congress and its organization, procedures, and enumerated powers are set forth in other sections of the Constitution. Likewise, the constitutions of the several states also establish authoritative lawmaking bodies (the state legislatures). Rules of legislative law are promulgated as formalized legal documents in authoritative textual form (statutes or codes) that are prospective in application—that is, the legislative acts are rules of law or precepts to be followed in the future. Legislation, as described by Oliver Wendell Holmes, "looks to the future and changes existing conditions by making a new rule to be applied thereafter to all or some part of those subject to its power" (*Prentis v. Atlantic Coast Line Co.* 1908).

Legislation is generally more authoritative than case law and supersedes prior judicial decisions, unless the enactments exceed the legitimate powers of the legislature (i.e., unless they are unconstitutional). Judges are bound by the statute as it is enacted and cannot rewrite it or revise it. When a particular statutory law governs the resolution of a case before the court, the judge's role is merely to apply it to the controversy to be decided.

STATUTORY CONSTRUCTION (INTERPRETATION)

Chung Fook v. White, 264 U.S. 443 (1924)

Certiorari to a judgment of the Circuit Court of Appeals that affirmed a judgment of the District Court denying a petition for a writ of *habeas corpus.* Mr. Justice Sutherland delivered the opinion of the Supreme Court:

> Chung Fook is a native-born citizen of the United States. Lee Shee, his wife, is an alien Chinese

> woman, ineligible for naturalization. In 1922 she sought admission to the United States, but was refused and detained at the immigration station, on the ground that she was an alien, afflicted with a dangerous contagious disease [chlonorchiasis]. No question is raised as to her alienage or the effect or character of her disease; but the contention is that nevertheless, she is entitled to admission under the proviso found in §22 of the Immigration Act of February 5, 1917, c. 29,39 Stat, 891. A petition for a writ of habeas corpus was denied by the Federal District Court for the Northern District of California, and upon appeal to the Circuit Court of Appeals, the judgment was affirmed.

The pertinent parts of the proviso are as follows: "That if the person sending for wife or minor children is naturalized, a wife to whom married or a minor child born subsequent to such husband or father's naturalization shall be admitted without detention for treatment in hospital." The measure of the exemption is plainly stated and, in terms, extends to the wife of a naturalized citizen only.

But it is argued that it cannot be supposed that Congress intended to accord to a naturalized citizen a right and preference beyond that enjoyed by a native-born citizen. The court below thought that the exemption from detention was meant to relate only to a wife who by marriage had acquired her husband's citizenship, and not to one who, notwithstanding she was married to a citizen, remained an alien under §1994 Rev. Stats…We are inclined to agree with this view; but, in any event, the statute plainly relates only to the wife or children of a naturalized citizen and we cannot interpolate the words "native-born citizen" without usurping the legislative function… The words of the statute being clear, if it unjustly discriminates against the native-born citizen, or is cruel and inhuman in its results, as forcefully contended, the remedy lies with Congress and not with the courts. Their duty is simply to enforce the law as it is written, unless clearly unconstitutional.

Affirmed

Courts are not always able to apply statutory law mechanistically or formalistically for a variety of reasons inherent in the legislative process. Even though the drafters of legislation strive to be precise and minutely specific in their phraseology, words are often imperfect symbols to communicate intent, sometimes resulting in vague or ambiguous meanings. Further uncertainties in legislative intent may be superimposed in the course of the legislative process of enactment (e.g., by the amendments added to the original bill). Unforeseen circumstances or unthought-of cases are bound to arise. As Hart observed,

> Human legislators can have no such knowledge of all the possible combinations of circumstances which the future may bring…. We have not settled, because we have not anticipated, the question which will be raised by the unenvisaged case when it occurs…. When the unenvisaged case does arise, we confront the issues at stake and can then settle the question by choosing between the competing interests in the way which best satisfies us. In doing so we shall have rendered more determinate our initial aim, and shall incidentally have settled a question as to the meaning, for the purposes of this rule, of a general word. (Hart 1961, 125–126)

There are a number of traditional judicial formulas for the resolution of doubts as to the legal effect of statutes, such as the plain meaning rule ("where the act is clear upon its face, and when standing alone, it is fairly susceptible of but one construction, that construction must be given to it" [*Hamilton v. Rathbone* 1899]) or the ascertainment of the legislative intent or purpose in enacting the legislation. *Chung Fook* is an example of the former approach (Llewellyn 1950; Murphy 1975). The following case excerpt considers legislative intent or purpose.

United States v. American Trucking Associations, 310 U.S. 534 (1940)

Mr. Justice Reed delivered the opinion of the Supreme Court:

> In the interpretation of statutes, the function of the courts is easily stated. It is to construe the language so as to give effect to the intent of Congress. There is no invariable rule for the discovery of that intention. To take a few words from their context and with them thus isolated to attempt to determine their meaning, certainly would not contribute greatly to the discovery of the purpose of the draftsmen of the statute…. (*United States v. American Trucking Association* 1940)

There is, of course, no more persuasive evidence of the purpose of a statute than the words by which the legislature undertook to give expression to its wishes. Often these words are sufficient in and of themselves to determine the purpose of the legislation. In such cases we have followed their plain meaning. When that meaning has led to absurd or futile results, however, this court has looked beyond the words to the purpose of the act. Frequently, however, even when the plain meaning did not produce absurd results but merely an unreasonable one "plainly at variance with the policy of the legislation as a whole," this court has followed that purpose, rather than the literal words…. The interpretation of the meaning of statutes is exclusively a judicial function. This duty requires one body of public servants,

the judges, to construe the meaning of what another body, the legislators, has said. Obviously there is danger that the courts' conclusion as to legislative purpose will be unconsciously influenced by the judges' own views or by factors not considered by the enacting body. A lively appreciation of the danger is the best assurance of escape from its threat, but hardly justifies an acceptance of a literal interpretation dogma… Emphasis should be laid, too, upon the necessity for appraisal of the purposes as a whole of Congress in analyzing the meaning of clauses or sections of general acts.

There is a substantial catalogue of judicial maxims or canons of statutory construction, formulated by the courts, to resolve interpretive questions. Judicial creativity is especially called for in those cases where the legislative issue to be determined was totally unforeseen by the lawmakers and the judge must assign a legal effect to the statute that it did not originally possess:

> Interpretation is often spoken of as if it were nothing but the search and the discovery of a meaning which, however obscure and latent, had nonetheless a real and ascertainable preexistence in the legislator's mind. The process is, indeed, that at times, but it is often something more. (Cardozo 1921)

When judges sometimes, under the guise of statutory interpretation, exceed the proper limits of their authority and go beyond or override the intent of the legislature in order to remake the law according to their own views (to achieve what they regard as a "good result"), they draw criticism that the courts are usurping legislative prerogatives and undermining the rule of law.

Judicial review of the constitution: Search and seizure, smartphones, and protecting digital privacy

ROBERT LLOYD GOLDSTEIN

INTRODUCTION

Modern cell phones are not just another technological convenience. With all they contain and all they may reveal, they hold for many Americans "the privacies of life." The fact that technology now allows an individual to carry such information in his or her hand does not make the information any less worthy of the protection for which the Founders fought. Our answer to the question of what police must do before searching a cell phone seized incident to an arrest is accordingly simple—get a warrant (*Riley v. California* 2014, 28).

Frequently, a police officer, in a reflective mood, will say "Judge, you know this Fourth Amendment makes my job a lot tougher and more difficult." What does one respond, except to say: "Officer, that's precisely what a Bill of Rights is for. Even in service, you are not permitted the efficiency permitted a counterpart in a Gestapo or an NKVD. From day to day, that is your burden; but from decade to decade and century to century, that is your glory…Yes, Officer, it makes your job a lot more difficult. It's supposed to!" (*Zimmerman v. State* 1989).

Democracy means that if the doorbell rings in the early hours, it is likely to be the milkman (Winston Churchill).

CONSTITUTIONAL JUDICIAL REVIEW

The Constitution of the United States has endured for over two centuries. It is the supreme Law of the Land, the ultimate legal authority in the complex hierarchy of our legal system. The Constitution establishes the norms that govern the distribution of law-making powers and their exercise within our system of authoritative sources of law, encompassing case law derived from court decisions, federal and state, and legislative enactments by the U.S. Congress and the 50 state legislatures. The Constitution proclaims its own supremacy and overriding authority in the Supremacy Clause of the Constitution (Article VI, Clause 2):

> This Constitution, and the Laws of the United States which shall be made in Pursuance thereof; and all Treaties made, or which shall be made, under the Authority of the United States, shall be the supreme Law of the Land; and the Judges in every State shall be bound thereby, any Thing in the Constitution or Laws of any State to the Contrary notwithstanding.

In 1803, the epic decision by Chief Justice John Marshall, in the seminal case of *Marbury v. Madison* (1803), declared that "It is emphatically the province and duty of the judicial department to say what the law is." This cornerstone doctrine of American constitutional law declared the basic principle that the U.S. Supreme Court had the authority to review acts of Congress and declare them void if they are in conflict with the Constitution ("repugnant to the Constitution"). This power of judicial review established the U.S. Supreme Court as the supreme arbiter and ultimate authority in the interpretation of the U.S. Constitution, the "final, formal interpreter of the words of the Constitution" (Mason and Beaney 1959). According to Mr. Justice Jackson, addressing the finality of the court's authority to interpret the Constitution: "We are not final because we are infallible, but we are infallible only because we are final" (*Brown v. Allen* 1953, 540). Later Supreme Court decisions extended the court's power to review and invalidate state court decisions and state legislation it determines to be unconstitutional. Although there is no explicit provision in the U.S. Constitution that confers the power of constitutional judicial review on the court, nevertheless, its supremacy in this regard has been legitimized

by popular acquiescence and approval over the course of American history and is generally respected by the country as a permanent and indispensable feature of our entire constitutional system (Tepker 2004).

SEARCH AND SEIZURE

The Fourth Amendment to the U.S. Constitution is the part of the Bill of Rights that prohibits unreasonable searches and seizures of property by the government. It protects against arbitrary arrests and is the basis of the law regarding arrest and search warrants, stop-and-frisk, wiretaps, and other forms of surveillance. It requires that any warrant issued be supported by "probable cause." Probable cause to search requires a fair probability that contraband or evidence of a crime will be found in a particular place (Emanuel 2014). Adoption of the Fourth Amendment was in response to the many abuses associated with writs of assistance, a type of general search warrant issued by the British government during the colonial era. Writs of assistance gave British officers of the Crown virtually unbridled authority to conduct raids and rummage through homes, in an unrestrained search for evidence of criminal activity. The authorities possessed almost unlimited power to search for anything and seize personal property (such as charts, pamphlets, personal effects, and any other items, as well as contraband) at any time, with very little oversight. These abusive and unreasonable British colonial policies were viewed at the time by future U.S. President John Adams as "the spark which originated the American Revolution" (Adams and Adams 1856). The Fourth Amendment, which has been the subject of more Supreme Court decisions than any other area of criminal procedure (Goldstein 2007), holds that

> The right of the people to be secure in their persons, houses, papers, and effects against unreasonable searches and seizures, shall not be violated, and no Warrants shall issue but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched and the persons or things to be seized. (U.S. Constitution, Amendment IV)

The ultimate touchstone of the Fourth Amendment is reasonableness. Most arrests are warrantless but must be made on probable cause to make the arrest. Probable cause to make an arrest requires a reasonable likelihood that a violation of the law has been committed by the individual to be arrested (Emanuel 2014). Warrantless searches incident to a lawful arrest occur with far greater frequency than searches conducted pursuant to a warrant. In a long line of cases, the Supreme Court has refined the constitutional contours of the search incident to arrest doctrine and crafted a number of rules to assess the reasonableness of these exceptions to the warrant requirement (*Chimel v. California* 1969; *U.S. v. Chadwick* 1977; *New York v. Belton* 1981; *Virginia v. Moore* 2008). The court has long recognized that it is reasonable to search the person arrested and the area "within his immediate control" in order to seize any weapons (that might be used to resist arrest, escape, or endanger the officer's safety), as well as to search and seize any evidence on his or her person to prevent its concealment or destruction. In *U.S. v. Robinson* (1973), the court took it one step further by concluding that since the custodial arrest of a suspect based on probable cause was already a reasonable and legal intrusion under the Fourth Amendment, a warrantless search incident to the arrest of the personal property of the arrestee, for example, a crumpled pack of cigarettes found to contain heroin, was permissible and required no additional justification. The court explained that "the authority to search the person incident to a lawful custodial arrest, while based upon the need to disarm and to discover evidence, does not depend on what a court may later decide was the probability in a particular arrest situation that weapons or evidence would in fact be found upon the person of the subject" (*Robinson* 1973, 235). In other words, any privacy interests a suspect retained after a full-custody arrest were significantly diminished by virtue of the arrest itself. Other warrantless searches that the court has upheld as reasonable include the "protective sweep" of the premises incident to an arrest in the suspect's home (*Maryland v. Buie* 1990) and the search of a vehicle's passenger compartment, under certain circumstances, when it was reasonable to believe evidence relevant to the crime of arrest might be found in the vehicle (*Arizona v. Gant* 2009).

Katz v. United States: Fourth Amendment protection of the "reasonable expectation of privacy"

The first wiretap case decided by the Supreme Court was *Olmstead v. United States* (1928). The court's ruling allowed the government to obtain private wiretapped telephone conversations without a warrant and place them into evidence. The court held that the Fourth Amendment's protection against unreasonable searches and seizures only applied to *places* and *things*. It did not apply to intangible conversations passing over telephone wires. Moreover, the court pointed out that the tap had been placed on wires outside the premises; a violation of the Fourth Amendment required a physical trespass on the subject's property.

In a famous (and prophetic) dissent, Mr. Justice Brandeis wrote:

> The progress of science in furnishing the Government with means of espionage is not likely to stop with wire-tapping. Ways may some day be developed by which the Government, without removing papers from secret drawers, can reproduce them in court, and by which it will be enabled to expose to a jury the most intimate

> occurrences of the home. Advances in the psychic and related sciences may bring means of exploring unexpressed beliefs, thoughts and emotions. "That places the liberty of every man in the hands of every petty officer"… Can it be that the Constitution affords no protection against such invasions of individual security? (*Olmstead v. United States*, 1928, 474)

Nearly 40 years later, in 1967, the Supreme Court rejected *Olmstead* and extended Fourth Amendment protection to all areas where an individual has an actual (subjective) reasonable expectation of privacy and society is prepared to recognize that this expectation is (objectively) reasonable. In *Katz v. United States* (1967), the court rejected the traditional notion that only private property was protected by the unreasonable search and seizure clause of the Fourth Amendment. Katz, a bookmaker, had used a public pay phone booth to transmit long-distance illegal bets. The FBI, acting without a warrant, recorded his incriminating conversations via an electronic recording device attached to the exterior of the phone booth. There was no physical intrusion into the booth itself. Prior to *Katz*, the standard had been that the police must have physically intruded into a constitutionally protected area, such as the private property of the suspect. The Fourth Amendment was generally meant to protect "things" from intrusive physical search and seizure; it was not meant to protect personal privacy. The court, in holding that government wiretapping was subject to the Fourth Amendment's warrant requirements, wrote that "One who occupies [a telephone booth], shuts the door behind him, and pays the toll that permits him to place a call is surely entitled to assume that the words he utters into the mouthpiece will not be broadcast to the world" (*Katz v. United States* 1967, 353). The court determined that immaterial intrusion with technology violated Katz's reasonable expectation of the right to privacy. Even though Katz made the phone calls on public property and the FBI did not physically trespass in installing the device, the court held that the Fourth Amendment protected his justifiable reliance on the expectation of privacy, even in a place accessible to the public. The court emphasized that "the Fourth Amendment protects people, not places" (*Katz* 1967, 352), and therefore, physical intrusion is not necessary to constitute a "search."

TECHNOLOGY ON AN ACCELERATING EXPONENTIAL CURVE: A CHALLENGE FOR THE LAW

> I am not an advocate for frequent changes in laws and constitutions, but laws and institutions must go hand in hand with the progress of the human mind. As that becomes more developed, more enlightened, as new discoveries are made, new truths disclosed, and manners and opinions change with the change of circumstances, institutions must advance also, and keep pace with the times.
>
> **Thomas Jefferson, excerpt from letter to Samuel Kercheral, July 12, 1816**

It has become something of a truism that the law faces great difficulties keeping pace with the social repercussions of technology (Wadhwa 2014). This is hardly surprising. In the first two decades of the twentieth century, there was more technological advancement than in the entire nineteenth century. Ours is a world of exponential technological progress. Kurzweil has predicted that we will not experience 100 years of progress in the twenty-first century—it will be more like 20,000 years of progress. In his "Law of Accelerating Returns," he refers to change of this magnitude as *the Singularity*—"change so rapid and so profound that it represents a rupture in the fabric of human history" (Kurzweil 2006). Other futurists, such as Moravec and Hawkins, point to the emergence of increasingly sophisticated technologies over the course of human history (e.g., the invention of imagery, writing, mathematics, printing, the telescope, flight, rockets, radio, television, the computer, and on and on), separated by shorter and shorter intervals, until a point beyond human comprehension will be reached (Moravec 1990; Hawkins 2002). The law has struggled to keep up with the proliferation of advances in technology in recent years, such as clandestine government surveillance programs, genome testing, cloning, self-driving cars, drones, robots, Google, Facebook, and, of course, the ubiquitous smartphone.

Riley v. California (2014) was a landmark case involving the unique privacy interests at stake when police conduct a warrantless search incident to arrest of the digital contents of a suspect's smartphone. Chief Justice Roberts noted that the sale of cell phones has topped 1.2 billion worldwide. In the United States, 64% of adults now own a cell phone of some kind. There are more than a million "apps" (mobile application software on a cell phone) available at each of the two major app stores. The average cell phone owner has installed over 30 apps, "which together can form a revealing montage of the user's life" (*Riley v. California* 2014, 20). The court observed that these phones "are now such a pervasive and insistent part of daily life that the proverbial visitor from Mars might conclude they were an important feature of human anatomy" (*Riley v. California* 2014, 9). Privacy advocates heralded the decision for striking a major blow in favor of digital privacy rights and reaffirming the principle that technological advances should not result in an erosion of "the protection for which the Founders fought."

RILEY V. CALIFORNIA: THE NEW *KATZ* FOR THE DIGITAL ERA

A San Diego police officer stopped David Riley for a traffic violation, which eventually led to his arrest on weapons charges after firearms were discovered under his car's hood.

While searching Riley incident to his arrest (without a warrant), the police seized a smartphone from his pants pocket. A warrantless search of his smartphone's data uncovered evidence of Riley's ties to the "Bloods" street gang and records that placed his phone at a shooting some 3 weeks earlier. They also found photographs of Riley standing in front of a car they suspected had been involved in the earlier shooting incident. Riley was ultimately convicted of assault with a semiautomatic firearm, shooting at an occupied vehicle, and attempted murder. The California Court of Appeal affirmed his conviction.

The Supreme Court held that warrantless searches of a cell phone incident to arrest were unreasonable and constituted a violation of the Fourth Amendment. The court established a bright line rule: "Our answer to the question of what police must do before searching a cell phone seized incident to an arrest is accordingly simple—get a warrant" (*Riley v. California* 2014, 28). Writing for a unanimous court, Chief Justice Roberts held that cell phones store uniquely private information. He resoundingly rejected the government's argument that searching an arrestee's smartphone was comparable to a search of the contents of a physical item, such as a crumpled pack of cigarettes found on his person, while looking for contraband.

> That is like saying a ride on horseback is materially indistinguishable from a flight to the moon. Both are ways of getting from point A to point B, but little else justifies lumping them together. Modern cell phones, as a category, implicate privacy concerns far beyond those implicated by the search of a cigarette pack, a wallet, or a purse. A conclusion that inspecting the contents of an arrestee's pockets works no additional intrusion on privacy beyond the arrest itself may make sense as applied to physical items, but any extension of that reasoning to digital data has to rest on its own bottom. (*Riley v. California* 2014, 17)

The court went on to emphasize that although an arrestee has diminished privacy interests, it "does not mean that the Fourth Amendment falls out of the picture entirely" (*Riley v. California* 2014, 16). The court noted that in today's world, smartphone users "keep on their person a digital record of nearly every aspect of their lives—from the mundane to the intimate" (*Riley v. California* 2014, 19). The *Harvard Law Review* analyzed the court's reasoning as follows:

> Where cell phones are concerned, privacy interests are at their apogee. Quantitatively, cell phones have an "immense storage capacity" that houses a vast array of information moored far into the owner's past. Qualitatively, cell phones may reveal detailed information about all aspects of a person's life through browsing history, geolocation data, and apps…Cell phone searches implicate privacy interests that are not only substantial, but also ubiquitous. (Harvard Law Review 2014)

The historic English common law dictum that "an Englishman's home is his castle" (which was adopted by the American colonists as the *Castle Doctrine*) is reflected in the special protections that a person's home and property receive under the Fourth Amendment. The King did not have unbridled authority to intrude on his subjects' dwellings: "The house of every one is to him as his castle and fortress, as well as for his defense against injury and violence as for his repose" (*Semayne's Case* 1604). As noted above, the Fourth Amendment was a response to the British government's reviled writs of assistance, which served as a general type of search power giving officers of the Crown arbitrary and unbridled authority to search any home without cause. The court, in this regard, argued that the privacy interests at issue in the search of a smartphone's digital contents are paramount even to those at stake in the search of a home, traditionally regarded as the most sacrosanct and inviolable place under American law. The court observed that ransacking an individual's home, in an exhaustive search for everything that might be incriminating, would actually be less intrusive than searching the individual's smartphone. The court explained that a smartphone "not only contains in digital form many sensitive records previously found in the home; it also contains a broad array of private information never found in a home in any form—unless the phone is" (*Riley v. California* 2014, 20–21).

In *Katz*, the court rejected the traditional approach that the Fourth Amendment protected only private property from unreasonable government intrusion. It extended that protection to government infringement on the individual's reasonable expectation of privacy ("The Fourth Amendment protects people, not places"). "*Riley* is the new *Katz*… [a landmark decision that] marks the beginning of increased protections for privacy in the digital age" (Lamparello and MacLean 2014, 4). It is an auspicious sign that the court has successfully kept pace with the times and remains steadfastly committed to safeguarding "the protection for which the Founders fought."

Tort law and the psychiatrist

J. MICHAEL HEINLEN

INTRODUCTION

Psychiatrists today face a broad range of potential liabilities as a result of their professional activities. Consider the following scenario. A former patient has accused her psychiatrist of engaging in sexual activity with her during the course of treatment. As a result, (1) the psychiatrist faces criminal sexual assault charges; (2) he is being sued by the former patient for battery and malpractice; (3) the hospital with which he had been affiliated has terminated his privileges; and (4) his insurance carrier says it will not bear the costs of his defense or pay any damages assessed against him at trial. This example illustrates the three types of practice-related legal disputes a psychiatrist is most likely to encounter: criminal, tort, and contract.

Criminal law involves the state asserting its interest in maintaining public order. It does not seek to resolve private disputes; rather, its goals are to punish or reform offenders and to deter crime (Holmes 1881, 41–51). In a criminal trial, the prosecutor, acting as the state's agent, brings charges against a defendant and must prove beyond a reasonable doubt (i.e., with 90%–95% certainty) that the defendant committed the crime. At the end of the trial, the fact finder, often a jury, decides whether the defendant is guilty or innocent. In the present example, the state's interest is in preventing sexual assault. In most jurisdictions, the prosecutor in such a case must convince a jury that the sex acts occurred and were not consensual (Simon 2001, 221–223). The use of drugs, hypnotism, or threats of harm to induce compliance can be presented as evidence that the acts were involuntary, and lack of consent is assumed if the patient was a minor or incompetent. Several states go further and ban any sexual contact between psychiatrists and their patients. In those states, the prosecutor need only prove that the sexual conduct occurred and that it was intentional.

Civil law, as opposed to criminal law, comprises contract law and tort law and has evolved to settle disputes. *Contract law* comes into play when parties to an agreement disagree about the terms of the agreement (Farnsworth 1999, 3–26). Typically in a contract suit, one party believes the other has failed to fulfill its obligations under the agreement. The aggrieved party, the plaintiff, sues the other, the defendant, for breach of contract. Each presents its evidence and arguments at trial, and the fact finder finds for either the plaintiff or the defendant. If it finds for the plaintiff, the defendant can be forced to comply with the terms of the contract or be compelled to pay money damages to the plaintiff for losses incurred as a result of the breach. Our example presents two possible contractual disputes. First, the psychiatrist might bring an action against the hospital for terminating his privileges. Second, if he is found liable in the malpractice suit, he may claim that his insurance policy binds the insurer to pay any damages assessed against him. In either case, the result will depend on an analysis and interpretation of the terms of the pertinent contract.

Tort law seeks to resolve disputes over attribution of blame and responsibility for harm (Prosser 1971, l–7). Like criminal law, it comes into play when someone's actions violate social norms. But unlike criminal law, where the state brings charges against defendants, the injured parties, themselves, assert tort claims against those who injured them. At trial, the fact finder must decide by a preponderance of the evidence (i.e., greater than 50% certainty) whether a defendant is liable. If the defendant is found liable, the fact finder can assess damages to be paid to the plaintiff.

In the example, battery and psychiatric malpractice are tort claims. To prevail on her battery claim, the patient, like the prosecutor in the criminal trial, will need to convince the fact finder that the psychiatrist coerced her into engaging in the sexual activity. Unlike the prosecutor, however, she need only prove this by a preponderance of the evidence, not beyond a reasonable doubt. Further, the patient can win in the tort action even if she consented to the sexual conduct. If she can prove that having sex with a patient falls below the requisite standard of care for psychiatrists and that the sexual activity aggravated her underlying condition, the fact finder can find the psychiatrist liable for malpractice.

WHY HAVE TORT LAW?

Before tort law as we know it now existed, private vengeance was a sacred duty. If your neighbor mistook your father for a wild boar and shot him with an arrow, you did not bring a wrongful death action. Rather, you and your family undertook a moral obligation to kill a member of the offender's family. This was the blood feud. Though it came to be regulated—the types of wrongs that could be expiated by blood were ultimately limited, as were the days and locations on which revenge could be exacted—private wrongs were settled privately throughout most of the Middle Ages (Bloch 1961, 125–130). Since that time, tort law has evolved as an alternative means of dispute resolution.

Justifications for tort law

In common-law jurisdictions, such as England and the United States, tort law has developed into a system that assigns responsibility for harm to wrongdoers and compensates injured parties for their losses. It is a judge-made collection of rules to impose liability for damages. Theorists justify tort law primarily on four grounds: (1) it maintains public order; (2) it alleviates the hurt suffered by victims of wrongdoing; (3) it compensates victims for their losses; and (4) it deters harmful behavior (Prosser 1971, 1–7; Shuman 1994, 3–8). As to the first, one of the reasons tort law originally developed was to constrain the mayhem inherent in a legal system based on the blood feud. Today, it remains a tool for channeling angry conflicts into (relatively) peaceful confrontations. Further, insofar as it imposes moral and financial responsibility for harm on wrongdoers, tort law helps appease the need for vengeance satisfied by the blood feud.

On a more tangible level, the award of money damages in tort judgments is justified on the ground that it restores victims to their pre-harm state. In other words, tort law compensates people who have been injured by unsafe behavior. If you wreck my car, for example, I am entitled to an award of damages to cover both the cost of repairing or replacing the car and any expenses and losses incurred as a result of the accident. In addition, forcing wrongdoers to pay for their mistakes may deter harmful behavior. These are the two most common justifications for tort law—restitution and deterrence. It compensates people harmed as a result of unsafe behavior that society wants to prevent.

There are, however, significant problems with these justifications. On the most basic level, there is no proof that fear of potential tort liability alters people's behavior (Shuman 1993, 165–166). And even if there were such proof, liability insurance and government compensation programs, along with the time and expense of litigation, minimize the deterrent effects of tort law. Studies show that 90% of accident victims who recover for their losses are paid by third-party insurers or compensation plans, not through tort actions. In addition, the high emotional and monetary cost of taking a case to trial discourages many victims from making claims (Hensler et al. 1991, 107–108, 175). In practice, only insured or wealthy wrongdoers who have caused serious—i.e., costly—injuries get sued. As a result, much harmful behavior escapes the tort system.

The time, expense, and emotional upheaval of litigation also make clear that tort law is not the most effective means of compensating injury victims. Indeed, the costs of obtaining tort compensation are higher than for other compensation systems. A further problem is that many damage awards include sums to compensate for pain and suffering. But unlike tangible losses, pain and suffering cannot readily be valued in monetary terms. Though it is relatively easy to compute the money needed to replace a car or to pay hospital expenses, how does one appraise the value of pain endured as a result of a car accident? Simply put, "tort damages cannot 'buy out' the pain in the same way they can 'buy out' the hospital bill" (Shuman 1994, 46). Insofar as money damages cannot restore victims to a pain-free state, an alternative theory has been offered to justify them; namely, that damages for pain and suffering serve as offsetting substitute pleasures (Ingber 1985, 784). Even though someone might suffer from chronic pain, that pain can be offset, for example, by the ability to buy a fancy house or to relax on a beach in Hawaii. Unfortunately, there is no empirical evidence to support the contention that damage awards can, in fact, mitigate a victim's pain (Shuman 1994, 47 n.37).

There are, thus, numerous unsettled issues regarding the policies and rationales underlying tort law. Despite such theoretical debates, it remains, without question, a body of law that functions in practice to make people who engage in unsafe conduct subject to liability to their victims when that conduct results in injury.

VARIETIES OF TORT

Historically, tort law has been concerned with two types of injury-causing behavior: negligent and intentional. In the modern era, most tort actions have been based on negligence; the law holds people responsible when their careless behavior harms others. Tort law, however, also compensates victims of intentionally bad acts. Someone who commits assault and battery may not only have to answer to the state in a criminal trial, he or she can also be sued by the victim in a civil trial and be the subject of an award of damages. Although tort claims against psychiatrists are limited to claims of negligent and intentional tort actions, there is a third variety of tort, strict liability, which is confined almost solely to cases involving the marketing and distribution of dangerous products. This is an unusual tort because a defendant can be found liable even without a showing of fault. In a strict-products-liability action, the plaintiff need only prove that a seller or manufacturer of dangerously defective goods placed those goods into the stream of commerce and that those goods caused harm (*Restatement [Second] of Torts* 1965, §402A).

Negligent torts

A plaintiff must prove four essential elements to prevail in a tort suit based on negligence: duty, breach, cause, and harm (Prosser 1971, 143–144). The first element requires proof that the defendant owed the plaintiff a duty of care. Next, the plaintiff must show that the defendant breached the duty and that the breach caused harm. The general standard by which the defendant's duty is measured is reasonable care under the circumstances (Terry 1915). The issue is whether a reasonable person in the defendant's position would have acted as the defendant did.

As an example, a store owner has a duty to the public to maintain the sidewalk in front of his store in a safe, passable condition. This duty arises from the fact that whenever someone engages in behavior that will foreseeably have an impact on other people, such as exploiting a public sidewalk for the purpose of attracting customers, he has a duty to behave in a manner that will not harm those people. If the store owner allows the concrete on the walk to become so worn and cracked that people might trip when passing by, he risks a negligence action if someone falls and hurts herself. By neglecting to maintain the walk, the store owner breached his duty and any injury caused by that breach is compensable in tort. Note that a plaintiff need not prove intent in a negligence action. It is irrelevant that the store owner did not mean to hurt anyone. The question is simply whether he failed to use reasonable care in fulfilling his duty. If so, and if that failure caused harm, the plaintiff is entitled to recover damages for her injury.

The shop owner in such a case may have a number of defenses. For instance, he can deny that he breached a duty, arguing that it would have been unreasonable to expect him to maintain the walk in better condition than he did. He can dispute causation, arguing that the plaintiff's injuries occurred because someone pushed her, not because she tripped on the defective sidewalk. Or he can question the harm, for instance, by claiming that no damage was done. If the plaintiff waited too long to file the lawsuit, the shopkeeper can even bar the claim on procedural grounds. Every state has a statute of limitations that requires tort suits to be brought within a specified period after discovery or occurrence of the allegedly negligent act.

Psychiatric malpractice

Medical malpractice refers to negligent torts committed by health-care professionals acting in the course of their professional duties. A psychiatrist whose unreasonable care harms a patient or a third party to whom a duty is owed may be liable for malpractice. In the context of malpractice claims, the duty element of the tort is normally established by showing the existence of a doctor–patient relationship (Rigelhaupt l982; Simon 2001, 20–22; Simon and Shuman 2007, 17–36). As soon as a psychiatrist agrees, either explicitly or implicitly, to diagnose or treat a patient, duties arise. Whether such an agreement was made is a fact question, and when this is in dispute, the court must decide. Generally, however, it is not difficult for plaintiffs to prove the element of duty. Giving advice to friends and neighbors, providing sample medications, or prescribing medication during the course of independent medical evaluations can give rise to a doctor–patient relationship. The psychiatrist's duty to the patient then remains until the doctor–patient relationship is terminated, either by a unilateral act of the patient, mutual agreement that services are no longer required, or by a unilateral act of the psychiatrist (in the latter case, termination should be accompanied by reasonable notice to the patient and assistance in providing a new therapist).

Psychiatrists have a duty to exercise reasonable care in treating their patients. Failure to do so is a breach of the duty to the patient (Simon and Shuman 2007, 6, 9–10). This does not mean the treatment must be perfect or extraordinary; rather, it means that the psychiatrist must "possess and exercise the degree of skill and learning possessed and exercised, under similar circumstances, by the members of his or her profession in good standing, and to use ordinary and reasonable care and diligence, and his or her best judgment, in the application of his or her skill to the case" (*Corpus Juris Secundum* 2005, 556: Physicians and Surgeons §83). The question of whether a defendant exercised the requisite standard of care in any given case is an issue to be decided by the fact finder based on the testimony of expert witnesses. Indeed, this is where most of the action in malpractice suits lies.

Courts have found that psychiatrists also owe duties to third parties in at least three contexts. *First*, when a psychiatrist recognizes, or reasonably should recognize, that a patient poses an imminent threat of serious harm to an identifiable third party, in many states the psychiatrist has a duty to protect that individual from injury. Failure to warn the intended victim or notify the police may be a breach of the duty (Simon 2001, 179–182; Simon and Shuman 2007, 165–168, 182–185). *Second*, in cases involving recovered memory of sexual abuse or ritual satanic abuse, some states have found that therapists owe a duty to individuals who could potentially be misidentified as playing roles in such abuse. Thus, if, as a result of treatment, the patient falsely accuses someone of abuse, the psychiatrist has breached a duty to that individual and may be liable for damages (Simon 1998, 132–136; Berger 2000; Simon and Shuman 2007, 95–96). *Third*, some states allow the victims of a psychiatrist's patients to bring third-party malpractice claims against the psychiatrist. Such states recognize that when, as a result of negligent treatment, a patient injures another, the psychiatrist owes a duty to the victim of the patient's violent acts (Kussmann 2012, 575–578).

Once duty and breach have been established, a plaintiff must still prove that the breach caused injury. Tort law divides the causation element into two categories: cause-in-fact and proximate cause (Simon and Shuman 2007, 6–7). The cause-in-fact analysis considers whether the injury would have happened regardless of the psychiatrist's bad act. This is often expressed as a "but for" analysis, which

asks, "but for the wrongful quality of the therapist's conduct, would the plaintiff have suffered the same harm?" (Robertson 1997). If the injury would have occurred regardless of the wrongful conduct, the causation requirement is not satisfied. But if the wrongful conduct was a cause-in-fact of the injury, the plaintiff must also prove that there is a reasonably close, proximate, connection between the injury and the wrongful act. The standard used in making this determination is a reasonable foreseeability. When a reasonable person would have foreseen the risk of harm, the proximate cause element is met (Kelley 1991).

If the plaintiff can prove that she suffered harm as the result of a breach of the defendant's duty to her, she is entitled to an award of compensatory damages intended to restore her to the position she would have been in if there had been no negligent act. In extreme cases, involving willful, malicious, or reckless behavior, punitive damages may also be awarded. Negligence alone will not merit punitive damages, which are intended to punish the defendant, rather than to compensate the victim (Prosser 1971, 9–14, 313–323; Simon and Shuman 2007, 7–8).

Major areas of liability for psychiatric malpractice

NEGLIGENT TREATMENT

The law does not demand successful treatment, it merely requires that a psychiatrist perform in a manner consistent with the way an average reasonable psychiatrist would perform under similar circumstances. Although this is a rather nebulous standard, courts consider a number of specific practices as essential elements of the standard of care psychiatrists owe their patients. These include, for example, the duty to obtain a complete clinical history, to disclose adequate information to gain informed consent for treatment, to document all decisions made during the course of treatment, to supervise the patient's progress—both during and after treatment—and to monitor reactions to medication. Failure to comply with any of these duties can subject a psychiatrist to liability if the patient suffers harm as a result of treatment (Sarno 1981; Simon and Shuman 2007, 79–100; Simon 2001, 87–88).

CONFIDENTIALITY

Psychiatrists owe their patients a duty to maintain the privacy of all confidential communications (Zelin 1986; Shuman and Weiner 1987; Simon 2001, 41–44, 53–54). The issue of confidentiality actually involves two related concepts: confidentiality, per se, and testimonial privilege (Simon and Shuman 2007, 37–56). The duty of confidentiality is an ethical obligation that protects a patient's privacy by preventing disclosure of confidential information to third parties. Testimonial privilege refers to the patient's right to prevent a physician from disclosing information in a judicial proceeding. Testimonial privilege is most often established by statute or court rule, and it purports to resolve the ethical dilemmas on the part of a physician faced with conflicting duties—one to the patient to maintain confidentiality, and another to the court to tell the truth. Statutes or court rules resolve the dilemma by giving the patient the right to prevent the physician from testifying. In effect, they codify a public policy judgment that it is more important to safeguard patient privacy generally than to ascertain the truth in specific trial situations.

Absent an exemption, a psychiatrist who breaches the duty to maintain patient confidentiality risks a malpractice action. There are, however, several exemptions; the duty of confidentiality is not absolute. In certain circumstances it may be both legally and ethically permissible, even necessary, to divulge patient confidences. A patient, for example, may waive the right to confidentiality by requesting that medical records be sent to potential employers or insurers. Similarly, there is no right to confidentiality when a patient consents to be examined at the request of a third party, as for example in a disability hearing or litigation. There are also a number of contexts in which a psychiatrist may divulge patient information without the patient's consent. For instance, if the psychiatrist determines that a patient poses a risk of committing violence to self or others and the violence can only be prevented by intervention, the psychiatrist may intervene. Likewise, if the patient's judgment is markedly impaired and other people's lives depend on his or her sound judgment, as for example, an airline pilot or police officer, the psychiatrist may choose to divulge that information. In such cases, disclosure is a matter of choice; the psychiatrist has the option of maintaining the patient's confidence or disclosing the information. In other instances, there is no choice. Statutes define certain situations that mandate disclosure. Though these vary from state to state, statutory disclosure requirements typically apply in the following scenarios: when there is evidence of child abuse; on the initiation of involuntary hospitalization; when an identifiable third party has been threatened; where there is evidence of a past treasonous act; and where there is intention to commit a future crime.

There are also exceptions to the testimonial privilege. For instance, it generally does not apply in criminal proceedings, child custody disputes, child abuse proceedings, or civil commitment proceedings. Significantly, when a patient-litigant's claim or defense rests on his or her mental state, the patient loses the right to prevent the psychiatrist from testifying. Thus, there will be no privilege in malpractice suits brought by patients against their therapists.

NEGLIGENT RELEASE AND SUICIDE

As discussed, one of the general rules of tort liability is that a defendant's negligent act must be the proximate cause of the plaintiff's injury. If someone carelessly spills gasoline on the street, he or she will not necessarily be liable for the damage that follows when someone else intentionally throws a cigarette into the spill and causes a fire. The act of intentionally throwing the cigarette was an intervening cause of the fire, which arguably superseded or broke the chain of causation between the careless spill and the damage. Ordinarily,

only if the intervening act is careless or negligent are courts likely to find that the person who spilled the gasoline should have foreseen that a cigarette would be thrown into the spill (Prosser 1971, 270–289).

This is important to keep in mind with respect to the most common psychiatric malpractice claim—failure to prevent a patient from harming himself or herself (Kussman 2000; Simon 2001, 143–147; Simon and Shuman 2007, 131–163). Normally, suicide constitutes an intervening cause; regardless of anyone else's careless behavior, the suicide victim's own acts ultimately caused the harm. Psychiatrists, however, have a duty to protect their patients from themselves. The standard of care owed to all patients, regardless of the initial complaint, includes suicide risk assessments. If there is a perceived risk, the psychiatrist must take affirmative action to protect the patient. Failure either to diagnose the risk or to take adequate precautionary measures can result in liability when the patient commits or attempts to commit suicide. In either event, the reasonableness standard applies. The plaintiff must show that the suicide was reasonably foreseeable or that, in view of the perceived risk, the precautions taken were unreasonable.

Generally, the risk of liability is greater for inpatient than for outpatient suicides. Courts assume that it is easier to anticipate and manage suicidal patients in the controlled setting of a hospital. Typical claims involving inpatient suicides include charges of failure to supervise, failure to restrain, premature release, and negligent discharge. Limitations of control help shield psychiatrists from liability in cases involving outpatient suicides. In those situations, as noted, courts consider whether the treatment was reasonable. Claims might include charges of improper diagnosis, inadequate supervision, abandonment, lack of proper referral, or failure to hospitalize.

DUTY TO PROTECT

Psychiatrists do not only have a duty to prevent patients from harming themselves (Simon and Shuman 2007, 165–199; Kussmann 2012, 575–578). This is counter to the conventional rule, which holds that people have no duty to prevent one person from harming another (*Restatement [Second] of Torts*, §315A). Indeed, psychiatrists traditionally had only a limited duty to exercise control over institutionalized patients. Since 1976, however, with the decision in *Tarasoff v. Board of Regents of the University of California*, a California malpractice case, the psychiatrist's duty to third parties has expanded dramatically. *Tarasoff* involved a therapist who knew his patient was obsessed with another person. When the patient killed that person, the victim's family sued, claiming the therapist had breached a duty to warn the victim about the threat to her life. The California Supreme Court ultimately agreed, holding:

> [O]nce a therapist does in fact determine, or under applicable professional standards reasonably should have determined, that a patient poses a serious danger of violence to others, he bears a duty to exercise reasonable care to protect the foreseeable victim of that danger. While the discharge of this duty of due care will necessarily vary with the facts of each case, in each instance the adequacy of the therapist's conduct must be measured against the traditional negligence standard of the rendition of reasonable care under the circumstances. (*Tarasoff v. Board of Regents of the University of California* 1976, 345)

In reaching its decision, the court recognized that a duty to warn already existed in the context of certain, special relationships. Specifically, in some cases, a person who has the *right* to control another person also has a *duty* to control the other person's conduct. A physician, for example, could be liable for harm done by a patient on temporary leave from a mental hospital. *Tarasoff* expanded the existing law by designating the therapist–patient relationship as one of the special relationships that gives rise to such a duty. Since *Tarasoff*, a majority of states have established rules requiring psychiatrists to act affirmatively to protect third parties from a patient's violent acts. Though the laws vary, the general rule is that a duty to protect arises when a therapist determines, or by the standards of the profession should have determined, that a patient poses an imminent threat to an identifiable third party. The key issues are whether the violent act was foreseeable, whether there was an identifiable victim, and whether the psychiatrist warned the victim or notified appropriate authorities (Perlin 1992; Simon 2001, 179–182; Kussmann 2012, 520–531).

SEXUAL EXPLOITATION

Psychiatrists have a duty to refrain from having sex with their patients, and the states have been particularly resolute in enforcing this duty. Indeed, sexual contact with a patient subjects a psychiatrist to a host of legal and professional consequences, ranging from criminal prosecution on charges of sexual assault or rape; to civil suits alleging negligence, loss of consortium, or battery; to ethical sanctions; and to license revocation (Flaherty 1988; Simon 2001, 219–226). In the context of a malpractice claim, a plaintiff generally must prove that sexual contact took place in breach of the duty, and that harm, typically a degeneration in psychological condition, resulted. Several states have made it easier for plaintiffs to prevail by enacting statutes that make any sex between a therapist and patient both criminally and civilly actionable. Such laws create a statutory presumption of harm whenever a therapist engages in sex with a patient. Some states even allow the patient's spouse to bring an independent claim of loss of consortium (interference with the marital relationship) against the offending therapist. Though there are several potential defenses, including claims that the patient consented or that treatment had ended, once the court finds that sexual activity took place, it is exceedingly difficult for the defendant to prevail.

Intentional torts

The general rule regarding intentional torts is that a person is liable for harmful or offensive contact if he or she engages in a willful act with either: (1) the intent to harm or offend; or (2) substantial certainty that harmful or offensive contact will result (Prosser 1971, 31–34). Whether contact is offensive is determined on the basis of a reasonableness standard (contact is offensive if it offends a reasonable sense of personal dignity). Thus, a plaintiff bringing an intentional tort claim must prove that the defendant intentionally did something harmful or offensive or that the defendant knew with substantial certainty that his or her actions would result in harm or offense (Jung and Levine 1987). Characteristic intentional torts include assault, battery, false imprisonment, and defamation.

Because a plaintiff must prove what was in the defendant's mind when he or she acted, it is generally more difficult to prove intent than negligence. Once intent has been shown, however, it is much easier to prove causation. In contrast to negligent torts, there is no foreseeability requirement in intentional torts. The intent element applies only to the decision to engage in the harmful or offensive contact, not to the consequences of that conduct. If the defendant did a wrongful act, he or she is responsible for the consequences of that act even if the consequences were not foreseeable. Likewise, there is no probability standard. If the defendant meant to do something harmful or offensive, there is no requirement that success be highly likely. This means, for example, that someone who intentionally shoots a rubber band at a bus driver will be liable for all damages that accrue when the rubber band hits the driver in the eye, knocks her contact lens out, and causes a multivehicle accident. It makes no difference that the shooter only meant to annoy the driver and never intended to cause a catastrophic accident.

A defendant in an intentional tort action can claim that he or she acted in self-defense or that the plaintiff consented to the allegedly harmful act (Prosser 1971, 101–112). In a self-defense claim, the defendant must concede that he or she intended to harm the plaintiff. But the defendant will also argue that his or her acts were reasonable responses to the plaintiff's own threatening behavior. Another defense to an intentional tort action is consent. If the plaintiff willingly consented to the conduct, the defendant will prevail. To be effective, consent must be competent, knowing, and voluntary. That is, the plaintiff must have had sufficient information and mental capacity to make an informed decision, and his or her consent must not have been coerced or fraudulently obtained.

Major areas of psychiatric liability

BATTERY

The two most common intentional tort claims brought against psychiatrists are battery, brought when a patient alleges that treatment was provided without informed consent, and false imprisonment, typically in cases involving involuntary commitment. As to the first, patients must consent to treatment on the basis of information regarding the nature and consequences of the proposed medical regimen (Simon and Shuman 2007, 57–78). This requirement protects the patient's autonomy by preserving his or her right to determine what happens to his or her body.

As noted, informed consent must be competent, knowing, and voluntary (Moldoff 1961; Twerski and Cohen 1988; Simon 2001, 63–74). Competence is not something that can be calculated scientifically. It is context specific and involves considerations of a patient's ability to understand treatment options, make treatment choices, and communicate those choices. A patient's incompetence will not foreclose the ability to go ahead with treatment, it merely means that the psychiatrist will have to obtain substitute consent from someone authorized to provide it (e.g., a parent, guardian, or spouse). The knowing element of the consent requirement is met by providing the patient with sufficient information to make an informed choice. Traditionally, the amount of information necessary to fulfill this requirement has been measured on a professional standard. That is, the psychiatrist must provide the amount and kind of information a reasonable psychiatrist would disclose under the circumstances or that is customarily provided in his or her community. Many states, however, now have adopted a standard based on the patient's perspective, requiring the psychiatrist to provide all material information a reasonable person in the patient's position would want to know to be able to make an informed decision. Though there are no absolute rules regarding what kind of information is material, courts have looked favorably on the following: assessments of the patient's condition; the nature and purpose of the proposed treatment; risks and benefits of the treatment; viable alternatives to that treatment, along with the risks and benefits of the alternative treatments; and projected outcome with and without treatment. Finally, there are four limited exceptions to the consent requirement:

1. When emergency treatment is necessary to save a patient's life or to prevent imminent bodily harm, the law presumes consent if the patient cannot give consent and there is not adequate time to seek substitute consent.
2. If the patient is deemed incompetent, his or her consent is not required; nevertheless, consent must be obtained from a substitute decision maker.
3. If a psychiatrist believes that full disclosure would harm the patient's health, in a narrow set of circumstances full disclosure may not be required.
4. If the patient competently, knowingly, and voluntarily waives his or her right to information, the consent need not be informed.

If inadequate information was provided and none of these exceptions applies, a psychiatrist who begins treatment

without obtaining informed consent risks liability for negligence or, in the worst-case scenario, battery.

FALSE IMPRISONMENT

Under certain limited conditions, states grant psychiatrists the authority to hospitalize patients against their will under civil commitment schemes (Simon and Shuman 2007, 115–129). The requirements and procedures involved are provided in statutes, which vary from state to state. Although there are differences, three criteria underlie all involuntary commitment statutes. The patient must be mentally ill, he or she must present a threat to self or community, and he or she must be unable to provide for his or her own basic needs. If these conditions are met, the statutes generally insulate the committing psychiatrist from liability. A patient suing on the basis of false imprisonment must prove that the psychiatrist acted in bad faith in seeking commitment (Chase 1970; Simon 2001, 125–130).

PSYCHIATRIST AS WITNESS

Two types of witnesses offer testimony at trial: fact witnesses and expert witnesses. A fact witness, as the term implies, provides the court with the facts of the case—who did what, when, and where. The fact witness is limited to testifying about things that he or she directly witnessed or performed, and is generally limited in offering any personal opinions, drawing conclusions, or relating the opinions or reports of others. Whereas a fact witness need not have any special expertise, an expert witness is a person whose knowledge of a particular field is beyond the understanding of the average layperson. Experts appear in court to help jurors or judges understand the case by clarifying points about specialized topics. While an expert may testify as to facts, he or she is further permitted to offer opinions. Indeed, that is the main function of an expert witness.

A psychiatrist involved in a tort suit might appear in either capacity (Gutheil 1998a, 226–229; Gutheil 1998b; Gutheil 2010). Like anyone else, a psychiatrist might testify as a fact witness in a trial in which he or she is the plaintiff, but such a case would only rarely center on his or her professional role as a psychiatrist. Conversely, as a defendant in a malpractice action, the therapist would take the stand to report the facts of the case as he or she had observed them. Additionally, a treating psychiatrist might be called to testify in a suit involving a patient and a third party, as, for example, when the patient claims psychological injury as the result of an allegedly traumatic accident. In any event, when the therapist appears as a fact witness, he or she may only identify the patient's symptoms, the diagnosis applied, and the treatment prescribed. He or she may not take the additional step of testifying that the treatment met the requisite standard of care in the malpractice suit or of positing an opinion as to the causal link between the allegedly negligent act and the diagnosis of emotional distress in the patient's claim against a third party.

As a properly qualified expert witness, the psychiatrist may offer opinions regarding causation and standard-of-care issues. In tort cases alleging psychological harm, for instance, a psychiatrist/expert may be called to establish both the extent of such damages and the link between them and the traumatic event. In a malpractice suit, she may review the facts of the case at issue and offer opinions about how they relate to the elements of a negligence claim. Thus, she may give opinions as to whether a doctor–patient relationship had been established, whether the defendant's performance met the required standard of care, the extent of any damages, and whether there was a causal link between any negligence and the damage suffered.

SUMMARY

Tort law seeks to deter harmful conduct and compensate victims of such conduct. It is generally concerned with two types of injury-causing behavior: negligent and intentional. As applied to psychiatrists, this means that psychiatrists have a duty to exercise reasonable care in treating their patients. Failure to provide such care is *negligent*, and a psychiatrist whose unreasonable care causes foreseeable harm may be liable for malpractice. Tort law also bars psychiatrists from *intentionally* harming their patients. A patient who is harmed by a psychiatrist's negligence or intentional acts may be entitled to recover damages to compensate for the harm.

SUMMARY KEY POINTS

The following are examples of acts or omissions that may result in liability for malpractice if they cause foreseeable harm:

- Failure to provide treatment in manner consistent with the way an average reasonable psychiatrist would perform under similar circumstances
- Failure to maintain the privacy of confidential patient communications
- Failure to prevent a patient from harming himself or herself
- Failure to prevent a patient from harming others
- Engagement in sexual activity with a patient

The following are examples of intentional acts that may result in tort liability:

- Providing treatment without informed consent
- Seeking involuntary commitment in bad faith

An introduction to civil procedure

ROBERT LLOYD GOLDSTEIN

CIVIL PROCEDURE AND PROCEDURAL JUSTICE

Civil procedure establishes an orderly continuum of rules of litigation in the civil justice system. It is best defined as "the sum total of rules, forms, doctrines, and devices" that govern the formal activities of a technical nature in the adjudication of civil disputes (Grilliott 1979, 223). The principal objective of procedural rules is to provide a fair process for ascertaining the truth and delivering substantive justice in civil lawsuits. Procedural rules "should be construed and administered to secure the just, speedy, and inexpensive determination of every action and proceeding" (Federal Rules of Civil Procedure [FRCP] Rule 1 2015). A number of research studies involving the social psychology of the dispute resolution process have demonstrated the central importance of a litigant's perception of fundamental fairness in procedure (even when the litigant is disappointed by the substantive outcome) (Tyler 1998; Lind and Tyler 1998). Adherence to the standards of "procedural justice" is crucial to maintain confidence in the institutions of dispute resolution. Procedural justice implements the substantive law and provides litigants with a sense of receiving fair treatment before an unbiased and impartial tribunal. Golding has set forth the basic standards of procedural justice as follows:

- *Neutrality*: No man should be the judge in his own cause; the dispute settler should have no private stake in the outcome; the dispute settler should not be biased in favor of or against any party.
- *Persuasive conflict*: Each party should be given fair notice of the proceedings; the dispute settler should hear the argument and evidence of both sides; the dispute settler should hear a party only in the presence of the other party; each party should be given a fair opportunity to respond to the arguments and evidence of the other party.
- *Settlement*: The terms of the settlement should be supported by clearly articulated reasons; the reasons should refer to the arguments and evidence presented (Golding 1975, 113).

The Federal Rules of Civil Procedure (FRCP) govern court procedure for civil lawsuits in the 94 U.S. Federal District Courts (which are the trial courts for federal cases). The FRCP were established in 1938 and are revised and amended periodically. (The most recent amendments went into effect on December 1, 2010.) Most of the states have adopted rules of civil procedure for use in their own state courts that are based on the FRCP. (A nationwide dual system of federal and state courts exists side by side.) The FRCP are grouped into 11 titles (which comprise 86 rules), as follows:

Title I—Scope of Rules; Form of Action
Title II—Commencing an Action; Service of Process; Pleadings, Motions, and Orders
Title III—Pleadings and Motions
Title IV—Parties
Title V—Disclosures and Discovery
Title VI—Trials
Title VII—Judgment
Title VIII—Provisional and Final Remedies
Title IX—Special Proceedings
Title X—District Courts and Clerks; Conducting Business; Issuing Orders
Title XI—General Provisions

Perusal of the 11 FRCP titles attests to the immense breadth and purview of the subject matter of civil procedure. It is well beyond the scope of this modest introduction to the topic for a readership of forensic mental health professionals to undertake more than a superficial overview of modern-day civil procedure. A brief survey cannot do justice to a subject of such enormous complexity. For those who wish to explore more fully any particular aspect of civil procedure, a number of casebooks and hornbooks are available that provide an exhaustive, in-depth exposition of this fundamental cornerstone of the law (Wright and Kane 2011; Friedenthal et al. 2013). In the following sections, a necessarily condensed sample of selected topics is presented, to attempt to convey the flavor of some of the issues that shape procedural law within our adversarial judicial system.

CIVIL PROCEDURE AND THE ADVERSARIAL SYSTEM

The adversarial system is observed primarily in countries where the Anglo-American common law system predominates. The American judicial system is based on the adversarial model (except for Louisiana, whose civil code derives predominantly from a version of the French Code Napoleon) (Kagan 2003). The various stages of a civil lawsuit, from filing to final judgment, are governed by the applicable rules of civil procedure, whether federal or state. Lawyers master the intricacies of the rules of procedure to promote their cases and gain a competitive advantage over their opponents, within the constraints of the rules, at each stage of the proceedings. The adversarial system is *lawyer centered*. The lawyer-advocates for each party shape and control the litigation. "The central precept of the adversary system is that the sharp clash of proofs presented by opposing lawyers, both zealously representing the interests of their clients, generates the information upon which a neutral and passive decision maker can most justly resolve a dispute" (Asimow 2007, 653).

Most of the pretrial and trial decisions, the most critical tactical decisions, are made and carried out by the lawyers for each party, who frame the issues, undertake investigations and discovery, present the evidence, decide which witnesses to call, select expert witnesses, present the evidence, examine witnesses, conduct cross-examinations, and make their arguments to the jury. At trials, the judge plays a more passive role, acting as an impartial moderator and referee on points of law, and seeing to it that the rules are followed to ensure fair play. (Nevertheless, it should be noted that judges play a very active role in many aspects of the cases over which they preside, for example, deciding motions for summary judgment, aggressively trying to settle cases, and acting as gatekeepers in deciding questions regarding the admissibility of proffered expert testimony) (Asimow 2007).

JURISDICTION

The adjudicatory authority of the court, whether it has the power or competence to decide a given controversy, is known as *jurisdiction*. The term generally denotes the requisite authority of the forum court to decide the particular matters involved in the case before it (subject matter jurisdiction) and the requisite power over a given defendant and/or his or her property (*in personam* jurisdiction and/or *in rem* jurisdiction), to enable it to enforce the legal obligations owed by the defendant. *In personam* jurisdiction gives the court the power to hold the defendant personally liable, issue a judgment against him or her, and seize his or her assets. *In rem* jurisdiction empowers the court to decide claims relating to a piece of property or a legal status (e.g., marriage). In addition to meeting all the requirements for jurisdiction, considerations of procedural due process require that the forum court must ensure that the party whose rights will be affected is provided adequate notice and an opportunity to be heard in conjunction with any assertion of *in personam* or *in rem* jurisdiction (Weinstein 1992).

JURISDICTION OVER THE PARTIES

Originally, the chief basis for personal jurisdiction was premised on notions of state sovereignty. The actual presence of the individual within the state was the basis of personal jurisdiction, because the court could exercise power over those within the territorial or geographic boundaries of the government (of which the court was a part) and render binding judgments against that individual. In the early cases, physical presence within the state was the primary, if not the sole, basis for personal jurisdiction. In the leading case, *Pennoyer v. Neff* (1877), the Supreme Court held that if a defendant voluntarily ventured into the forum state and was personally served with process while present there, that would be sufficient to exercise personal jurisdiction over him or her.

Physical presence is still a valid method of getting jurisdiction. *Pennoyer* is still good law: when an out-of-state resident, if only briefly, voluntarily travels to the forum state (with which he or she has no other contacts) and is served with process while there, then the local court has personal jurisdiction over him or her. In *Burnham v. Superior Court* (1990), a New Jersey man, subsequent to separating from his wife, traveled to California for a short visit on business and to see his children (who had moved there with their mother after the marital separation). While he was in California, his wife served him with process for a divorce lawsuit to be tried in that state. The Supreme Court held that in-state service was a constitutionally valid basis for California to exercise personal jurisdiction.

Another basis of jurisdiction premised on state sovereignty is *domicile*. A state can exact reciprocal duties and obligations from its citizens in return for the protection and privileges it accords them. Thus, the courts of a state may constitutionally exercise *in personam* jurisdiction over an individual domiciled in that state, who is temporarily absent from the jurisdiction, when service of process takes place out of state. (Domicile has been defined as the place where a person has his or her permanent principal home; the place to which, even if he or she were temporarily absent, they intend to return.) Domicile is roughly equivalent to state citizenship. Even if a person has a number of residences, he or she can have but one domicile at a time. The leading case allowing *in personam* jurisdiction on the basis of domicile within the forum state is *Milliken v. Meyer* (1940). The Supreme Court held that "domicile in the state is alone sufficient to bring an absent defendant within the reach of the state's jurisdiction for purposes of a personal judgment" (provided that the individual was given actual notice of the proceedings and an opportunity to be heard by extraterritorial service of process). Under modern jurisdictional theories, a further basis of jurisdiction is recognized when a state exercises jurisdiction over a nonresident motorist who is involved in a motor vehicle accident within the forum state. In such a situation, the state has the right,

premised on its police power, to protect its citizens who are injured by an inherently dangerous instrumentality, namely, the motor vehicle. (However, only "specific jurisdiction" is conferred, i.e., jurisdiction is allowed only for any lawsuit based on the in-state accident itself.) In these cases, in-state service of process may be made on a designated official of the forum state, e.g., the Director of the Bureau of Motor Vehicles, with service by registered mail on the nonresident defendant (Wright and Kane 2011).

These nonresident motorist cases are only one example of modern-day jurisdictional theories and doctrines, designed to keep pace with the realities of the twentieth and twenty-first centuries. The rapid technological advances of the modern age, which have resulted in the emergence of our more progressively mobile and interconnected society, have challenged the law to keep up with the social repercussions of technology since the time of *Pennoyer*'s antiquated physical presence rule. In response to the changing times, all states have enacted "long-arm statutes" that confer extraterritorial jurisdiction over nonresident individuals or corporations who are physically absent from the state, provided that the prospective defendants have sufficient "minimum contacts" with the forum state.

Long-arm statutes have adopted specific standards for personal jurisdiction, based on certain kinds of activity within the forum state, including the transaction of any business in the state, the commission of a tortious act within the state, the commission of tortious acts outside the state that cause injury within the state (provided that the defendant conducts business activities in the state), the ownership, use, or possession of real estate within the state, or entering into contracts to insure any person, property, or risk located in the state.

The basis of jurisdiction that underlies the long-arm statutes, and that has come to provide the theoretical underpinning of modern-day jurisdictional doctrine, was set forth by the Supreme Court in the landmark case *International Shoe Company v. State of Washington* (1945). In this modern era of increasing interstate mobility of individuals, as well as the growth of corporate business activities nationwide, the law needed to keep pace. Courts needed to craft new, more flexible standards for the assertion of personal jurisdiction over nonresidents and out-of-state corporations by a forum state in which they operated, transacted business, or with which they otherwise had significant contacts. Consequently, the Supreme Court went beyond the physical power theory of jurisdiction established in *Pennoyer* (which had come to be viewed as rather anachronistic) and established the new "minimum contacts" test. The court explained:

> Historically the jurisdiction of courts to render judgments in personam is grounded on their de facto power over the defendant's person…But now…due process requires only that in order to subject a defendant to a judgment in personam, if he be not present within the territory of the forum, he have certain *minimum contacts* with it such that the maintenance of the suit does not offend "traditional notions of fair play and substantial justice." (International Shoe Company 1945, 316)

The minimum contacts test provides a local forum for local plaintiffs to bring a lawsuit against nonresident individuals or corporations. However, plaintiffs can do so only if it seems sufficiently fair to impose the burden on the out-of-state defendants to have to travel to the forum state to defend the action. For example, it would be considered fair for a court to exercise jurisdiction (and would satisfy the minimum contacts test) "if a corporation…is continuously and systematically entering the state" to market its products there. The Supreme Court has placed increased emphasis on due process considerations in adopting its minimum contacts doctrine, as a limit on the power of courts to assert *in personam* jurisdiction. In a long line of cases, the court has attempted to refine the requisite standards for "the kind and sufficiency of contacts needed to bring a defendant within the threshold of *International Shoe*" and has extended the minimum contacts requirement to jurisdiction over property as well as person (*Buckeye Boiler v. Superior Court of Los Angeles County* 1969; *Shaffer v. Heitner* 1977; *Kulko v. Superior Court* 1978).

With technology on an accelerating exponential curve, and with changes so rapid, unique, and profound in this Internet era, long-arm statutes have been seriously challenged in cases involving Internet commercial and defamation disputes. A key issue involves whether an individual may bring an action and enforce a judgment in his or her own state, or whether the action must be brought in the state where the defendant resides or where the business is located. Jurisdictional disputes of this nature have resulted in the adoption of new standards. In *Zippo Manufacturing v. Zippo Dot Com* (1997), the defendant, based in California, had electronically entered into online contracts with thousands of paying customers in Pennsylvania, the plaintiff's state of incorporation. The plaintiff brought suit in Pennsylvania for a variety of trademark offenses. The Pennsylvania court announced a new standard based on the presumption that the exercise of personal jurisdiction is "directly proportionate to the nature and quality of commercial activity that an entity conducts over the Internet." The court held that in a case wherein a defendant enters into contracts involving the "knowing and repeated transmission of computer files over the Internet, personal jurisdiction is proper."

SUBJECT MATTER JURISDICTION

In addition to the requirement that a court have jurisdiction over the parties, it must also have the power to adjudicate the kind of controversy before it. This is referred to as S*ubject Matter Jurisdiction*. Jurisdiction over the subject matter, in state and federal courts, is limited by the requirements of constitutional provisions, as well as by specific

state and federal statutes. For example, state statutes may authorize particular courts to adjudicate only certain types of litigation, such as probate and domestic relations matters. Perhaps the most common method of distributing judicial power is according to the dollar amount in controversy (e.g., in California, most matters in which the dollar amount involved is less than $25,000 are restricted to the municipal courts; most matters involving a greater amount are assigned to the superior courts). These courts are said to have "original jurisdiction" over the lawsuit. Other specialized tribunals are given appellate jurisdiction to review the decisions of the trial courts (Friedenthal et al. 2013).

Federal courts exercise subject matter jurisdiction over two basic types of controversies: Diversity of Citizenship cases and Federal Question cases. Diversity of Citizenship jurisdiction is based on Article III, Section 2 of the Constitution, which confers subject matter jurisdiction on the federal courts in regard to 'Controversies…between Citizens of different states," subject to many qualifications. Historically, the rationale underlying Diversity Jurisdiction was the avoidance of actual prejudice to out-of-state litigants in state courts (as well as the elimination of out-of-state litigants' apprehensions about potential prejudice, whether justified or not) by offering them the alternative of a presumably more unbiased federal forum. In all diversity cases, the amount in controversy must exceed $75,000. (The party seeking to invoke federal diversity jurisdiction does not have to prove that the amount in controversy exceeds that amount but only has to make a good faith claim to that effect.) This provision serves to limit access to the federal courts to the more significant cases, in an attempt to control the caseload of an already overloaded system. Federal Question jurisdiction involves jurisdiction by the federal courts over a substantial claim founded directly on federal law. For example, a claim for copyright or trademark violation derives from federal law, namely, the federal copyright or trademark statutes. Other examples of Federal Question cases are actions against federal officials and cases arising under the securities laws or antitrust laws. In Federal Question cases, there is no amount in controversy requirement (Emanuel 2014).

RULE 26 EXPERT REPORTS

Forensic mental health professionals who testify in federal court are well advised to acquaint themselves with the provisions of Federal Rule 26, which is the basic rule of the FRCP dealing with experts, covering a broad range of issues, from expert compensation (Goldstein and Laskin n.d.) to trial preparation protection for communications between a party's attorney and expert witnesses (*Republic of Ecuador v. Bjorkman* 2012). The rule provides that each party must automatically furnish a list (at least 90 days before trial) that identifies any experts it intends to call at trial. Rule 26(a)(2)(B) requires that the party who will call a retained expert must have the expert prepare and sign a report containing all of the expert's opinions and the basis for them, the facts or data considered by the expert in forming the opinion, any exhibits to be used by the expert, the expert's qualifications (including a list of all publications authored within the preceding 10 years), the compensation the expert is receiving, and a list of any other cases in which he or she has testified as an expert (at deposition or trial) within the preceding 4 years. Treating physicians are generally not required to submit a report (but disclosure must be provided setting forth the subject matter on which the witness is expected to present evidence and a summary of the facts and opinions to which the witness is expected to testify). By requiring full disclosure, Rule 26 serves to prevent the tactic of unfair surprise at trial from affecting the outcome of the case (Rocco 2008).

The Supreme Court, in *Daubert v. Merrell Dow Pharmaceuticals, Inc.* (1993), determined that federal trial judges should be the "gatekeepers" whenever the admissibility of scientific or technical evidence is challenged. The judges' preliminary task is to ensure that scientific evidence is not only relevant, but that it rests on a reliable foundation. "The inquiry envisioned by the Court is viewed as a flexible one, with its overarching subject the scientific validity (and thus the evidentiary relevance and reliability) of the principles and methodology of the proposed testimony (as distinguished from the conclusions that it generates)" (Goldstein 2003, 794). Pretrial *Daubert* hearings are frequently used by trial courts to fulfill their gatekeeping responsibility, in deciding questions of the admissibility of proffered expert testimony. "Rule 26 reports are perhaps the single most important piece of evidence in a *Daubert* hearing" because "the court will have before it a complete statement of all the opinions to which the expert will testify and their factual basis." Accordingly, the Rule 26 report "often serves as the cornerstone of reliability analysis under *Daubert*" (Rocco 2008, 2234).

An introduction to significant issues in criminal procedure

ROGER J. BERNSTEIN AND ROBERT LLOYD GOLDSTEIN

The tendency of those who execute the criminal laws of the country to obtain convictions by means of unlawful seizures and enforced confessions, the latter often obtained after subjecting accused persons to unwarranted practices destructive of rights secured by the Federal Constitution, should find no sanction in the judgments of the courts, which are charged at all times with the support of the Constitution, and to which people of all conditions have a right to appeal for the maintenance of such fundamental rights.

The efforts of the courts and their officials to bring the guilty to punishment, praiseworthy as they are, are not to be aided by the sacrifice of those great principles established by years of endeavor and suffering which have resulted in their embodiment in the fundamental law of the land.

***Weeks v. United States*, 232 U.S. 383, 392, 393 (1914)**

INTRODUCTION

The adoption of the U.S. Constitution was conditioned on simultaneous approval of the 10 amendments constituting the "Bill of Rights." Reflecting the colonists' concern with arbitrary exercises of government power and with protection of individual rights, 4 of these 10 amendments impose significant limits on the procedures that governments can use to investigate crime and to try individuals accused of crimes. Moreover, within these 10 amendments at least 16 distinct limitations on government conduct can readily be discerned.

Because these protections in the Bill of Rights are broadly phrased, they have been held to apply to modern-day law enforcement techniques, such as wiretaps, that were unknown when the amendments were adopted. In the last hundred years these protections have been held to apply to police lineups and other identification procedures, to custodial interrogations of suspects, to police seizure and examination of cell phones, and to many other aspects of modern-day criminal procedure.

The need to solve crimes often creates significant pressure on judges to give the broad phrases in the Bill of Rights a constrained interpretation, in the name of apprehending the guilty and protecting the public. Judges have often expressed concern that an expansive interpretation of the Bill of Rights "would … reduce the efficiency of crime prevention and detection to a degree which would seriously endanger public safety" (*United States v. Robinson* 1966, 114–115). This law enforcement imperative has frequently led the U.S. Supreme Court—or at least a majority of its justices—to adopt a narrow view of the constitutional protections against law enforcement overreach. This pressure has also caused the court to carve out exceptions to these protections. The pressure to relax these constitutional protections is particularly acute because evidence that the government has obtained by conduct that violates these protections is often excluded from prosecutor use at trial to convict even where the most serious crimes are charged.

The U.S. Supreme Court has plenary authority to determine how federal and state courts shall interpret and apply the protections in the Bill of Rights. However, a number of state constitutions also contain their own protections for the accused in the criminal justice process. Some state courts have interpreted their state constitutions as providing protections significantly greater than those required by the federal Bill of Rights.

This chapter presents an overview of the U.S. Supreme Court decisions concerning conflicts between individual rights and law enforcement in some of the most heavily litigated areas of criminal procedure. Because case law

varies in different jurisdictions and is constantly evolving, this discussion is necessarily general; it is at most a starting point for further analysis in any individual case.

FOURTH AMENDMENT LIMITATIONS ON ARREST, SEARCH, AND SEIZURE

The basic purpose of the Fourth Amendment "is to safeguard the privacy and security of individuals against arbitrary invasions by governmental officials" (*Camara v. Mun. Court of City and County of San Francisco* 1967, 528). This amendment, which governs all searches and arrests conducted by government agents, contains two grammatically independent but closely related clauses. The first clause provides the following:

> The right of the people to be secure in their persons, houses, papers, and effects against unreasonable searches and seizures, shall not be violated, …

The second clause provides:

> [A]nd no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched and the persons or things to be seized.

The first clause, which sets out a reasonableness test for searches and seizures, does not require that a warrant be issued for a search or arrest. It has been up to the Supreme Court to determine when the second clause applies so that a warrant is required for a search or arrest. Many of the Supreme Court's cases express a general preference for warrants; however, in a large number of cases the court has approved warrantless searches.

The second clause only applies to those searches that require a warrant. It sets out requirements for probable cause and particularity that govern not only the issuance of search and arrest warrants by judges and magistrates but also their execution. In practice the standard for probable cause is not exacting. Probable cause to search has been defined by the Supreme Court as "a fair probability that contraband or evidence of a crime will be found in a particular place" (*Illinois v. Gates* 1983, 238). The probable cause standard is a "practical, nontechnical conception" that is "not readily, or even usefully, reduced to a neat set of legal rules" (*Illinois v. Gates* 1983, 231–232).

Preference for warrants for searches or arrests inside a suspect's home

The judicial preference for requiring a warrant is strongest for searches of an individual's home. Because "the very core" of the Fourth Amendment protection against unreasonable searches and seizures is considered to be freedom from governmental intrusion within one's own home, a warrantless search of a home is presumptively unreasonable and therefore unconstitutional. Accordingly, the Supreme Court has held that police officers may not park outside a house and use a thermal imaging device to ascertain whether high-intensity lamps are being used inside to grow marijuana plants (*Kyllo v. United States* 2001, 31). The police may not place a beeper in a private residence without first applying for and securing a warrant, because placing such a device inside a home constitutes "a threat to privacy interests in the home…." (*United States v. Karo* 1984, 716). Moreover, because the "curtilage" surrounding a house is subject to the same privacy protection as the house itself, the police may not stand on the porch of a house with a narcotics-sniffing dog in order to detect possible narcotics activity inside the house (*Florida v. Jardines* 2013, 1413). On the other hand, the "curtilage" concept does not extend into the navigable airspace over a house. The police may operate an aircraft at 1000 feet over a house in order to see whether marijuana plants are growing in the backyard, even if the backyard is protected by a high fence (*California v. Ciraolo* 1986, 210). The rationale is that there is no valid expectation of privacy with respect to aerial observation of open-air activity, regardless of where it takes place.

Similarly, a high level of Fourth Amendment protection applies to a police entry into a home to effect an arrest. Unless the police can point to exigent circumstances, a warrant is required before police officers may enter a home to make "a routine felony arrest" (*Payton v. New York* 1980, 591). Moreover, the gravity of the offense will govern the degree to which exigent circumstances will excuse a failure to obtain a warrant for entering a home to effect an arrest. Even when "exigent circumstances" are present, the police may not enter a suspect's home to make an arrest for a minor, noncriminal traffic offense if they do not have a warrant authorizing the entry. The Supreme Court has held that the state's interest in prosecuting minor offenses is too slight to overcome the presumption of unreasonableness that attaches to warrantless entries into a home. But if there are exigent circumstances at the level of imminent destruction of evidence, or hot pursuit of a fleeing felon, or immediate threats to the safety of the public or the officers, the police may make a warrantless entry into a home to make a felony arrest (*Welsh v. Wisconsin* 1984, 750–753).

Electronic surveillance and privacy

Fourth Amendment protection has gradually been held to extend to electronic communications outside the privacy of one's home. In a 1967 decision the Supreme Court considered whether the warrantless placing of a listening device on the outside of a public telephone booth to record the user's telephone calls violated the Fourth Amendment. Significantly, the court declared for the first time that "the Fourth Amendment protects people, not places." A concurring opinion held that a search governed by the Fourth Amendment is deemed to have occurred when government officers violate a person's "reasonable expectation of

privacy" (*Katz v. United States* 1967, 360–362). The "reasonable expectation of privacy" approach, which often appears in subsequent Supreme Court cases, is inherently subject "to a degree of circularity" (*United States v. Jones* 2012, 962).

Some Supreme Court decisions have reflected a view that technological advances diminished a person's justified expectation of privacy. In 1983 the court held that the warrantless use of a "beeper" in a drum of chemicals to track the movement of the drum to a suspect's cabin did not transgress the Fourth Amendment. The court endorsed "augmenting the sensory facilities bestowed upon [the police]…with such enhancement as science and technology afforded them" (*United States v. Knotts* 1983, 282). Moreover, while *Katz* applies to communications by telephone, it does not apply to a pen register that only records the telephone numbers dialed from a telephone. The court reasoned that there is no reasonable expectation of privacy in the numbers dialed on a telephone because that information is voluntarily conveyed to telephone company personnel (*Smith v. Maryland* 1979, 739).

As technology has advanced further, however, the Supreme Court has increasingly found the Fourth Amendment's warrant clause to be applicable as a privacy protection. In 2012 the court considered whether government agents acting without a search warrant could install a GPS tracking device on the undercarriage of a car and track the vehicle's movements over the next 28 days. Employing divergent rationales, the court unanimously held that the installation and use of a GPS device to track a vehicle without prior judicial approval violated the Fourth Amendment. A number of the justices considered warrantless use of a GPS device to be a violation of individual privacy rights; others considered it to be a physical trespass upon property (*United States v. Jones* 2012).

Inevitably, police searches of cell phones have been the subject of a Fourth Amendment ruling. In 2014 the U.S. Supreme Court considered two cases in which police officers searched a "smartphone" and a "flip phone" post-arrest without a warrant. The prosecutors attempted to justify the warrantless searches of the seized phones as a permissible search incident to arrest that was necessary to prevent the destruction of evidence. However, noting "the immense storage capacity" of "modern cell phones" for personal and private information, the Supreme Court unanimously held that a warrantless search of a seized cell phone or smartphone is unreasonable (*Riley v. California* 2014, 2489). Among other things, it noted the inability of an arrested person to delete incriminating evidence from a properly secured cell phone that has been taken by the police. It did not credit prosecution fears of "remote wiping" of data from seized cell phones.

Case law is divided, thus far, as to whether there is a privacy interest in cell tower information that reveals the location of users of cell phones. Law enforcement is now able to use information from cell tower sites to track an individual's movements in real time on public roads and in private residences alike, as long as the individual is carrying a cell phone that is on. The Florida Supreme Court has suppressed evidence obtained by law enforcement officers who tracked a drug dealer through his cell phone usage without obtaining a warrant. Answering the question of whether Fourth Amendment privacy rights applied, the court held: "Requiring a cell phone user to turn off the cell phone just to assure privacy from governmental intrusion that can reveal a detailed and intimate picture of the user's life places an unreasonable burden on the user to forego necessary use of his cell phone, a device now considered essential by much of the populace" (*Tracey v. State* 2014, 523). Currently police departments and FBI agents are engaged in surreptitious warrantless use of devices that mimic a cell phone tower and provide the exact location of all cell phones using that tower, thereby sweeping up information about the cell phone usage and location not only of a suspect but also of every bystander using a cell phone in that vicinity. The constitutionality of this tactic has yet to be determined.

A significant amount of electronic surveillance in the form of eavesdropping on telephone calls is now regulated by statutes that generally require a warrant. In 1968 Congress passed a statute that specifically authorizes electronic eavesdropping and wiretapping of telephone calls by law enforcement officials, but only pursuant to a warrant based on probable cause (Omnibus Crime Control and Safe Streets Act 1968). The statute (which now applies to emails, text messages, and other electronic communications) requires several hurdles to be cleared before a warrant can be issued, such as demonstrating that other investigative methods have been tried and failed or reasonably appear unlikely to succeed. The statute contains exceptions to its warrant requirement for "an emergency situation" such as "conspiratorial activities threatening the national security interest." However, a warrant must be applied for within 48 hours after the eavesdropping begins, and if the application is not granted then the intercepted communications may be suppressed as a violation of the statute (Omnibus Crime Control and Safe Streets Act 1968). Although Congress did not explicitly authorize surreptitious breakins into private premises to install and remove electronic listening devices, the Supreme Court has held that such authorization is implicit in the statutory authorization to wiretap (*Dalia v. United States* 1979, 247–255).

Subsequent statutes culminating in the 2001 Patriot Act have, ostensibly in the interest of national security, authorized warrantless electronic surveillance or surveillance supervised only by a secret court. In several pending criminal cases (e.g., *United States v. Mohamud* 2014), the defendants are challenging the constitutionality of the National Security Administration's indiscriminate "vacuuming" of domestic electronic communications where those communications appear to have led to the criminal prosecution. A Supreme Court ruling on whether the Fourth Amendment precludes mass interception of private communications is not likely for quite a few years after the publication date of this treatise.

Finally, the Fourth Amendment does not prevent "undercover" recording of conversations. Federal law enforcement

officials, as well as law enforcement agents in most but not all of the states, are permitted to employ informants who unbeknownst to a suspect are "wired" to covertly record their telephone conversations without securing a warrant (*United States v. White* 1971, 750–754). Although the dissenting justices expressed concern about undermining "confidence and security in dealing with one another in individual relationships," the Supreme Court upheld the practice of secretly taping personal conversations. Its rationale is that an individual does not have a reasonable expectation of privacy in conversations with another person since that person may repeat from memory or from post-conversation notes what he or she has heard; therefore, a covert tape recording can be considered to be simply a memory aid. Instances of surreptitious electronic surveillance of forensic psychiatrists by patients have raised particular concerns regarding the erosion of trust in relationships that have traditionally depended on an expectation of privacy (Goldstein 1989).

Exceptions to the warrant requirement

As noted, the Supreme Court has deemed many types of warrantless arrests and searches to be permissible exceptions to the warrant clause of the Fourth Amendment. This is sometimes due to clearly exigent circumstances, but other times it rests on disputed premises about the actual needs of law enforcement. Moreover, when a warrant is not required, probable cause for a warrantless search is not invariably required (*Vernonia Sch. Dist. v. Acton* 1995, 653). The following categories of cases involve exceptions to the warrant and probable cause requirements. Some of these exceptions, such as the exception for "stop and frisk" searches by police officers, are applied in thousands of cases every year.

WARRANTLESS ARRESTS

In many circumstances officers may lawfully arrest an individual without an arrest warrant, provided that there is probable cause to believe that the person has committed or is committing a crime (*Gerstein v. Pugh* 1975, 111–114). Warrantless arrests are permitted for any felony offense that an officer has probable cause to believe a person has committed without regard to whether the officer was present when the felony occurred. Traditionally a law enforcement officer could only make a warrantless arrest for a misdemeanor if the misdemeanor was committed in the officer's presence. However, warrantless arrests for misdemeanors committed outside the presence of the arresting officer are now permitted by state statutes for an increasing number of misdemeanors and have not been held to violate the Fourth Amendment. In addition, as noted above, although a warrant is normally required to enter a dwelling to make an arrest, exigent circumstances can justify immediate entry into a dwelling to make a warrantless felony arrest.

After making a warrantless arrest, the arrested person must still be brought before a court for a judicial determination as to whether there was probable cause for the arrest. A delay of more than 48 hours between arrest and the court appearance can only be justified by "an emergency or some extraordinary circumstance" (*County of Riverside v. McLaughlin* 1991, 57).

INVESTIGATORY DETENTIONS ("STOP AND FRISK")

In *Terry v. Ohio* (1968) the Supreme Court held that "important government interests" can justify a brief investigatory police detention of a suspect on less than probable cause. If officers have "a reasonable, articulable suspicion" that someone is involved in criminal activity, they may stop him or her and question him or her briefly. They may also conduct a limited pat-down frisk for weapons if they reasonably believe that the individual poses a threat to the safety of the officers or others. If the brief investigative stop yields probable cause to believe that the stopped individual is engaging in criminal activity or has engaged in it, then arrest and prosecution can proceed without violating the Fourth Amendment. Not surprisingly, "*Terry* stops," often referred to with the phrase "stop and frisk," are a frequently used investigative method, one that is subject in a number of jurisdictions to issues of racially discriminatory deployment.

The grounds for upholding a claim of reasonable suspicion have been the subject of many decisions. A suspect's unprovoked flight upon seeing the police in an area of heavy narcotics trafficking can provide reasonable suspicion for an investigatory stop pursuant to *Terry* (*Illinois v. Wardlow* 2000, 124). However, an individual's simple presence in an area of expected criminal activity, standing alone, is not enough to support a reasonable, particularized suspicion that the person is committing a crime (*Illinois v. Wardlow* 2000, 124). While flight can provide reasonable suspicion, some courts have held that flight is not sufficient to find probable cause for an arrest. A lower court has held that "unprovoked flight, without more, cannot elevate reasonable suspicion to detain and investigate into the probable cause required for an arrest" (*United States v. Navedo* 2012, 474). Moreover, a number of state courts have declined to follow the U.S. Supreme Court's view that flight from police officers results in reasonable suspicion that criminal activity is afoot. For instance, the Tennessee Supreme Court has held that flight—even in areas of gang violence—is not sufficient grounds for an investigative stop (*State v. Nicholson* 2006, 661).

When reasonable suspicion is supported by police officer testimony, courts will not inquire whether the reason given by the police officer for a stop was pretextual. An automobile may be stopped where the police have probable cause to believe that a traffic violation has occurred, even if the actual motive of the police is to investigate drug activity (*Whren v. United States* 1996, 811–813).

The range of police activities permitted during an investigatory detention must be reasonably related to the circumstances that initially justified the detention (*United States v. Sharpe* 1985, 682). A state can require a suspect to disclose his or her name when a *Terry* stop has been made without violating either the Fourth or the Fifth Amendment

(*Hiibel v. Sixth Judicial Dist. Court of Nevada, Humboldt County* 2004, 187).

The involuntary transport of an individual to a police station for questioning is not considered to be a permissible "brief investigative stop" permitted under a *Terry* stop rationale (*Kaupp v. Texas* 2003, 630). Similarly, the police exceeded the limits of a "brief investigative stop" when they asked an airline passenger to accompany them to a small police room, retained his ticket and driver's license, and did not indicate that he was free to depart (*Florida v. Royer* 1983, 502–503). However, a 20-minute roadside stop does not fall outside the brevity requirement of *Terry* (*United States v. Sharpe*, 683). But, police officers who complete a stop of vehicle for a traffic infraction may not prolong the stop in order to investigate potential criminal activity unless there is a reasonable suspicion that a criminal offense is also occurring (*Rodriguez v. United States* 2015).

CONSENT SEARCHES

Government agents, without a warrant or probable cause, may conduct a search based on an individual's voluntary consent whether consent is express or implied (*Schneckloth v. Bustamonte* 1973, 219). The scope of a consent search may not exceed the scope of the consent given (*Florida v. Jimeno* 1991, 251).

A key issue for allegedly consented-to searches is voluntariness. Consent is not voluntary if given only because of a police officer's claim of lawful authority to conduct a search (*Bumper v. North Carolina* 1968, 548). Generally speaking, however, police officers may approach persons at random in most public places, ask them questions, and seek consent to a search. Even in a confined situation such as a bus or plane, a passenger's consent to a police officer's request to search his or her luggage is considered to be voluntary if "a reasonable person" would feel free to decline a police officer's request to search (*Florida v. Bostick* 1991, 436).

If there was an illegal arrest before consent is given, the subsequent consent to a search is generally invalid. In a 1983 case where the arresting officers lacked probable cause to make the arrest, the defendant's subsequent consent was "ineffective to justify the search" (*Florida v. Royer* 1983, 501–508).

Joint living arrangements have led to a complex body of law concerning the right of co-occupants of the same dwelling to give or withhold consent to a search. A co-tenant may validly give permission to a police officer to search jointly inhabited private premises when the other occupant is not present. The co-occupant may not subsequently object, because the co-occupant took the risk that his or her fellow occupant could admit visitors in his or her absence. However, when both occupants are present and one consents to the search while the other refuses to consent, the refusal to consent carries the day in order to protect the privacy interest in the home. The Supreme Court has held that a co-occupant's refusal to consent vitiates a search for which only one consent was obtained (*Georgia v. Randolph* 2006, 121–122). As the court observed, however, there is nothing to stop a consenting co-occupant from assisting the police in obtaining a search warrant and returning to the premises to conduct a court-authorized search.

SEARCHES INCIDENT TO A VALID ARREST

After making a valid arrest, police may conduct a warrantless search of the arrestee regardless of whether they have probable cause or reasonable suspicion to believe that the arrestee possesses weapons or prohibited substances or evidence pertaining to a crime (*New York v. Belton* 1981, 461). The rationale is the need to secure weapons that could be used to resist arrest or escape as well as the need to prevent the destruction of evidence. Generally, the scope of the permissible search incident to arrest is not limited to the arrestee's person but extends to the area within the arrestee's immediate control. A search incident to arrest is only valid if it follows the arrest; this exception "does not permit the police to search any citizen without a warrant or probable cause so long as an arrest immediately follows" (*Smith v. Ohio* 1990, 543). Nor does the issuance of a speeding citation, which does not involve an arrest, supply a basis for a search of the driver's car (*Knowles v. Iowa* 1998, 118).

Searches incident to the arrest of automobile occupants have been the subject of changing jurisprudence. The Supreme Court initially held that after arresting automobile occupants the police may search the passenger compartment of the automobile and any open or closed containers found therein without regard to the location of the arrested individual (*New York v. Belton* 1981, 460). This was intended to be a "bright line rule." However, in a 2009 case in which the arrested automobile occupants had been secured in patrol cars before their car was searched, a majority of the court held that the police officers could not search the vehicle because there was no valid concern about securing weapons or preventing escape. As a result, after arresting an automobile occupant, law enforcement may search the passenger compartment of a car "only when the arrestee is unsecured and within reaching distance of the passenger compartment at the time of the search" (*Arizona v. Gant* 2009, 343).

When individuals are arrested in a home, the police may search not only the area within the arrestee's immediate control, but also may search for weapons and confederates in "closed closets and other spaces immediately adjacent to the place of arrest from which an attack could be immediately launched." Since an arrest warrant only authorizes the seizure of the arrested person, after an in-home arrest the police may conduct a "protective sweep" beyond the spaces immediately adjacent to the arrest only if they have a "reasonable belief based on specific and articulable facts that the area to be swept harbors an individual posing a danger to those on the arrest scene" (*Maryland v. Buie* 1990, 334, 337). The protective sweep involves only a cursory inspection of those spaces where a person may be found and may last no longer than reasonably necessary to dispel a reasonable

suspicion of danger (*Thompson v. Louisiana* 1984, 21–23). Items in plain view may be seized during a protective sweep.

SEIZURE OF ITEMS IN PLAIN VIEW

Whether or not a protective sweep is involved, police may seize evidence that is in plain view without a warrant, provided that (1) they did not violate the Fourth Amendment in arriving at the place from which the evidence can be plainly viewed; (2) the searching officer has a lawful right of access to the evidence itself; and (3) the incriminating character of the evidence seized is immediately apparent (*Horton v. California* 1990, 136–137). To establish the incriminating character of an item, police must show that on examining that which is already exposed to view, they have probable cause to believe that it is evidence or contraband; a reasonable suspicion that an object might be contraband is not sufficient (*Arizona v. Hicks* 1987, 328). The court has expanded the plain view doctrine to include items discernible by plain touch in a pat-down search, such as a weapon that bulges under a coat, but not items whose character cannot be determined on plain touch but only by squeezing and sliding them after touching them (*Minnesota v. Dickerson* 1993, 378).

EXIGENT CIRCUMSTANCES

Government agents may conduct a warrantless search or seizure when probable cause exists and exigent circumstances justify proceeding without a warrant. Exigent circumstances exist when evidence is in imminent danger of destruction (*Cupp v. Murphy* 1973, 296); the safety of law enforcement officers or others is threatened (*Warden, Md. Penitentiary v. Hayden* 1967, 298–299); the police are in hot pursuit of a suspect, whether on public streets or into a private dwelling (*United States v. Santana* 1976, 42); or a suspect is likely to flee before the pursuing officer can obtain a warrant (*Minnesota v. Olson* 1990, 100).

VEHICLE SEARCHES

Police are not required to obtain a warrant to search an automobile but must have probable cause to believe that the vehicle contains contraband or evidence of criminal activity. The inherent mobility of vehicles, including when parked and unoccupied, creates exigent circumstances that generally make obtaining a warrant impractical (*Pennsylvania v. Labron* 1996, 940). However, when a car is parked and the suspect has already been arrested and is therefore unable to gain access to the automobile, the normal mobility of an automobile is deemed absent, and a warrant to search the car is required (*Coolidge v. New Hampshire* 1971, 460–461).

CONTAINER SEARCHES

The use of a closed or locked container does not create a reasonable expectation of privacy where probable cause to search it otherwise exists. When there is probable cause to believe that a vehicle contains contraband, the entire vehicle, including any closed containers within it, may be searched without a warrant (*Wyoming v. Houghton* 1999, 302). Upon making an arrest, police may examine the contents of any container within the arrestee's reach (*New York v. Belton* 1981, 460). No warrant is necessary to search the contents of trash receptacles left for collection (*California v. Greenwood* 1988, 40–42).

INVENTORY SEARCHES

The police may conduct a warrantless search of property of which they have lawfully taken custody to prepare an inventory, according to standardized criteria, for the purposes of (1) protecting the owner's property; (2) protecting the police against claims of lost or stolen property; or (3) protecting the police from potential danger (*S. Dakota v. Opperman* 1976, 369). An inventory search of a vehicle lawfully in police custody—including a search of the passenger compartment, glove compartment, trunk, and any containers in the vehicle—is considered reasonable under the first clause of the Fourth Amendment and therefore does not require a warrant (*Colorado v. Bertine* 1987, 371–372). This is so even if the vehicle has been impounded for nothing more than parking violations (*South Dakota v. Opperman* 1976, 369). However, a supposed inventory search will not be upheld if it is "a ruse for a general rummaging in order to discover incriminating evidence" (*Florida v. Wells* 1990, 4).

BORDER SEARCHES

The Fourth Amendment is virtually inapplicable at any international border. Routine border stops and searches of persons, luggage, personal effects, and vehicles may be conducted at the border or at its "functional equivalent" (e.g., an inland international gateway airport) without reasonably articulable suspicion, let alone probable cause (*United States v. Montoya de Hernandez* 1985, 538). The government may also conduct warrantless searches for illegal aliens at the border (*United States v. Martinez-Fuerte* 1976, 556–562). However, at points removed from the border the Fourth Amendment requires probable cause before border patrol agents may search vehicles (*Almeida-Sanchez v. United States* 1973, 269). On the other hand, a roving border patrol may stop a vehicle in the general area of the border and question its occupants if "specific, articulable facts" give rise to reasonable suspicion that the vehicle may contain illegal aliens, whereupon information uncovered in the stop can provide probable cause for arrest (*United States v. Brignoni-Ponce* 1975, 881).

When a border patrol agent stops a car away from the border, "apparent Mexican ancestry of the occupants of the car, standing alone, is not reasonable grounds for concluding that the occupants of the vehicle are illegal aliens" (*United States v. Brignoni-Ponce* 1975, 885–886). However, at a border or at an established checkpoint apparent Mexican ancestry by itself is a basis for diverting individuals for questioning and for searches of vehicles and personal property (*United States v. Martinez-Fuerta* 1976, 563).

The foregoing cases date from the 1970s and 1980s. More recently a lower federal court has decided that because of the growth of the Hispanic population, Hispanic appearance cannot be considered at all when a police officer claims to have had reasonable suspicion that illegal activity is taking

place (*United States v. Montero-Camargo* 2000, 1135). A lower federal court has also held that notwithstanding "the specter of 9/11," the Arab ethnicity and Arabic conversations of two airplane passengers could not be considered in determining whether there was probable cause to detain them as potential terrorists (*Farag v. United States* 2008, 460–468).

OTHER WARRANTLESS SEARCHES

Warrantless searches of businesses that are "pervasively regulated" because of public safety concerns are permitted where (1) there is a substantial state interest behind the regulatory scheme; (2) the search is necessary to further that scheme; and (3) the authorizing statute is an adequate substitute for the warrant requirement in giving notice to owners and limiting the discretion of those conducting the search. Moreover, government regulation can itself reduce an individual's reasonable expectation of privacy. For example, the court has held that an automotive junk dealer, who was required by statute to keep a record for police inspection of all automobiles and parts in his possession, had a reduced expectation of privacy in his business and could not have a Fourth Amendment objection to a warrantless (or suspicionless) search of his junkyard (*New York v. Burger* 1987, 702–711). Similarly, federally licensed gun dealers are subject to warrantless searches: "[w]hen a dealer chooses to engage in this pervasively regulated business and to accept a federal license, he does so with the knowledge that his business records, firearms, and ammunition will be subject to effective inspection" (*United States v. Biswell* 1972, 316). However, where an industry such as the hotel industry is not pervasively regulated, a warrantless search is impermissible. Obtaining evidence from a commercial concern that is not so regulated requires either a subpoena, that can be objected to before the compliance date, or a court-approved search warrant (*City of Los Angeles v. Patel* 2015).

Where a state program serves "special needs…beyond the normal need for law enforcement," the state may dispense with the warrant and probable cause requirements and have its searches judged solely by the reasonableness standard (*Chandler v. Miller* 1997, 314). For example, the Supreme Court has upheld warrantless random drug testing as justified by the special needs of public safety in the employment context (*Nat'l Treasury Employees Union v. Von Raab* 1989, 664; *Skinnery v. Ry. Labor Executives' Ass'n* 1989, 626–634). It has upheld warrantless searches of the offices or persons of public employees based on "reasonableness" rather than probable cause (*O'Connor v. Ortega* 1987, 713–714). It has upheld warrantless drug testing of public school students and warrantless searches of students by school authorities based on reasonableness rather than probable cause (*New Jersey v. T.L.O.* 1985, 341–342; *Vernonia Sch. Dist. 47J v. Acton* 1995, 653). It has also upheld warrantless searches of the homes of probationers and parolees on the premise that probationers only have conditional liberty and therefore reduced privacy expectations (*Griffin v. Wisconsin* 1987, 875–880).

THE FIFTH AMENDMENT, COERCED CONFESSIONS, AND OTHER SELF-INCRIMINATION ISSUES

The Fifth Amendment provides (in relevant part): "No person…shall be compelled in any criminal case to be a witness against himself." Police interrogation of a suspect in custody threatens the exercise of this Fifth Amendment privilege because the "inherently coercive" environment created by custodial interrogation can extract admissions against interest. For many years the courts focused simply on the voluntariness of in-custody confessions. However, as a result of "the coercion inherent in custodial interrogation" the Supreme Court's decision in *Miranda v. Arizona* (1968, 442, 479) laid down "concrete constitutional guidelines for law enforcement agencies and courts to follow" at the outset of interrogations. The police must warn a suspect "prior to any questioning" that "he has the right to remain silent, that anything he says can be used against him in a court of law, that he has the right to the presence of an attorney, and that if he cannot afford an attorney one will be appointed for him prior to any questioning if he so desires." As the court recently observed in an opinion reaffirming *Miranda*, "*Miranda* has become embedded in routine police practice to the point where the warnings have become part of our national culture" (*Dickerson v. United States* 2000, 430). Failure to give the *Miranda* warnings will result in the suppression of the un-warned statements in a prosecutor's case in chief under the "exclusionary rule" (discussed *infra*).

Miranda warnings are only required where a suspect is both in custody and subject to interrogation (*Illinois v. Perkins* 1990, 297). A number of Supreme Court rulings concerning these two requirements have circumscribed the application of *Miranda* fairly tightly.

Whether a suspect is in custody for purposes of *Miranda* warnings depends on the "objective circumstances," not on the subjective views of the interrogating officers or the person being interrogated (*Stansbury v. California* 1994, 321). A suspect is in custody if there is either a formal arrest or a restraint of movement to the degree associated with formal arrest. Outside the arrest context, however, the Supreme Court has held that custody "is a term of art" that applies only if there is a serious danger of coercion. In a number of situations involving questioning by law enforcement authorities, the court has held that the suspect was not in custody, and hence no warnings were required before incriminating statements could be sought. A prisoner moved to a prison conference room for questioning by detectives about an unrelated crime was not in custody for *Miranda* purposes because he had been told that he was free to return to his cell (*Howes v. Fields* 2012, 1189). Similarly, *Miranda* warnings were not required when an imprisoned suspect made incriminating statements to an undercover agent whom the suspect believed to be a cellmate, because the "essential ingredients" of a "police-dominated atmosphere" and "compulsion" were not present (*Illinois v. Perkins* 1990, 296–300). A routine meeting between an

individual and a probation officer does not constitute custody (*Minnesota v. Murphy* 1984, 429–434). Nor does "informal" detention of a suspect during the execution of a search warrant or detention pursuant to a routine traffic stop constitute custody that requires prequestioning warnings (*Michigan v. Summers* 1981, 702; *Berkemer v. McCarty* 1984, 422).

The Supreme Court has defined interrogation for purposes of *Miranda* warnings as "words or actions on the part of the police…that the police should know are reasonably likely to elicit an incriminating response from the suspect" (*Rhode Island v. Innis* 1980, 301). In addition to express questioning, other tactics such as "psychological ploys" designed to elicit incriminating responses may amount to interrogation (*Arizona v. Mauro* 1987, 526). A court-ordered psychiatric examination of an in-custody defendant constitutes an interrogation that may not be the subject of testimony absent *Miranda* warnings (*Estelle v. Smith* 1981, 462–463). In some situations, evidence obtained through a *Miranda* violation is nonetheless admissible. For example, the court held that testimonial evidence obtained from a suspect interrogated in custody was admissible despite the failure to give *Miranda* warnings because a threat to public safety had necessitated immediate police action (*New York v. Quarles* 1984, 654).

Silence during interrogation is not sufficient to invoke the right to remain silent; that right must be invoked unambiguously. However, a waiver of the right to remain silent need not be express; a waiver of the right to remain silent may be inferred from circumstances. For instance, if a suspect in custody receives the required warnings, remains silent for a period of time, and then elects to answer questions, it is "presumed" that the suspect understood his or her rights and "made a deliberate choice to relinquish the protection those rights afford" (*Berghuis v. Thompkins* 2010, 381, 385). Moreover, officers are not required to clarify an ambiguous request for counsel. The court has found a valid waiver of the right against compulsory self-incrimination where the defendant initially waived his right to counsel and then, during questioning, said: "Maybe I should talk to a lawyer." The court held that this statement was not sufficiently clear to alert a reasonable police officer that the suspect was in fact requesting an attorney (*Davis v. United States* 1994, 459).

There are limits on police ability to secure a waiver of *Miranda* protections. Once an individual clearly invokes the right to have an attorney, police officers may not later approach him or her, re-warn him or her, and subject him or her to further interrogation, unless that individual himself or herself initiates further exchanges or conversations with the authorities (*Edwards v. Arizona* 1981, 484–485). However, this prophylactic rule does not apply if there has been a break in custody of at least 14 days before the police again seek to question the suspect. The rationale is that the person has not been isolated in police custody for that time frame; hence, the coercive effect of custody is considered to have worn off (*Maryland v. Shatzer* 2010, 110).

Moreover, the "question first, warn later" strategy used by many police departments to induce suspects to waive the right to remain silent has been held to be an unconstitutional method of securing a waiver of Fifth Amendment rights. Many police departments have been trained to question a suspect first, then give the *Miranda* warnings, then repeat the same questions while playing on the idea that the suspect has already told them everything. The Supreme Court has held this ploy to be unconstitutional because its patent objective "is to render *Miranda* warnings ineffective by waiting for a particularly opportune time to give them, after the suspect has already confessed" (*Missouri v. Seibert* 2004, 611).

Even though a defendant has invoked his or her right to counsel and a lawyer has been appointed to represent the defendant on a charged offense, if he or she is no longer in custody the police may interrogate him or her about another suspected offense, even a factually related one, provided *Miranda* warnings are administered again (*Texas v. Cobb* 2001, 173).

Voluntariness remains a Fifth Amendment issue post-*Miranda*. Whether a confession is voluntary depends entirely on the presence or absence of coercive police activity, not on a defendant's mental condition. Thus, the fact that a suspect was a chronic schizophrenic who—after receiving *Miranda* warnings—confessed while in an acute psychotic state following a divine command hallucination, did not invalidate his confession to murder charges. The court reasoned that *Miranda* protects defendants against government coercion leading them to surrender rights protected by the Fifth Amendment; it goes no further than that. It commented: "[The defendant's] perception of coercion flowing from the 'voice of God', however important or significant such a perception may be in other disciplines, is a matter to which the United States constitution does not speak" (*Colorado v. Connelly* 1986, 169–171). Thus, absent evidence of police coercion, the confession of a severely mentally ill suspect, however unreliable it may otherwise appear to be, is constitutionally valid once *Miranda* rights are waived.

The Fifth Amendment applies only to testimony; it does not protect a suspect from being compelled to submit to "fingerprinting, photographing, or measurements, to write or speak for identification, to appear in court, to stand, to assume a stance, to walk, or to make a particular gesture" (*Pennsylvania v. Muniz* 1990, 591). Even though the act may provide incriminating evidence, a suspect may be compelled to put on clothing (*Holt v. United States* 1910, 252–253); to provide a blood sample (*Schmerber v. California* 1966, 765); and to provide a handwriting exemplar or a voice exemplar (*Gilbert v. California* 1967, 266; *United States v. Wade* 1967, 222–223).

THE SIXTH AMENDMENT RIGHT TO COUNSEL: EYEWITNESS IDENTIFICATIONS; COUNSEL OF ONE'S CHOICE

The Sixth Amendment provides (in relevant part): "in all criminal prosecutions, the accused shall enjoy the right …

to have the Assistance of Counsel for his defense." However, the amendment does not specify the stages of a criminal case to which the right to counsel applies.

Criminal defendants who are required to appear in pretrial lineups and show-ups have a constitutional right to have legal counsel attend. In *United States v. Wade*, the court held that a post-indictment, pretrial lineup is a "critical stage" of a criminal proceeding where the defendant has the right to be represented because of "the innumerable dangers" involved in eyewitness identifications (*United States v. Wade* 1967, 224). The court recognized that:

> the vagaries of eyewitness identification are well-known; the annals of criminal law are rife with instances of mistaken identification. Mr. Justice Frankfurter once said: "What is the worth of identification testimony even when uncontradicted? The identification of strangers is proverbially untrustworthy. The hazards of such testimony are established by a formidable number of instances in the records of English and American trials. These instances are recent—not due to the brutalities of ancient criminal procedure. (*United States v. Wade* 1967, 228)

Due to the dangers of subtle and not-so-subtle suggestion during lineup procedures, the court held that counsel's presence at a post-indictment, pretrial lineup was constitutionally required. Nevertheless, the court declined to hold that a failure to have counsel present at a lineup automatically required exclusion of the identification of the defendant at trial by the witnesses who had earlier identified him at the lineup. The witness' courtroom identification of the defendant would still be admissible if the government "could establish by clear and convincing evidence that the in-court identifications were based upon observations of the suspect other than the lineup identification" (*United States v. Wade* 1967, 240).

When suggestive elements in an uncounseled identification procedure made it "all but inevitable" that an eyewitness would identify the defendant, a subsequent in-court identification was suppressed (*Foster v. California* 1969, 443). But when a trial court in a subsequent case found that a witness's courtroom identification rested on "an independent recollection of her initial encounter with the assailant, uninfluenced by the pretrial identifications," the Supreme Court held that failure to have counsel present at a post-arrest lineup did not preclude courtroom testimony identifying the defendant (*United States v. Crews* 1980, 473).

Although there have been recent efforts to demonstrate the unreliability of eyewitness identifications, the court has held that trial judges are not required to prescreen eyewitness evidence for reliability merely because a pretrial identification is made under suggestive circumstances (*Perry v. New Hampshire* 2012, 725).

The right to counsel established in *Wade* does not apply when a witness identifies a defendant following the arrest of that defendant and prior to the actual commencement of criminal proceedings without counsel present. This is so even though the identification procedure immediately post-arrest may be just as suggestive as one post-indictment (*Kirby v. Illinois* 1972, 689–690).

Other forms of post-arrest police contact with an individual who has counsel may violate the Sixth Amendment. Police officers may not use an informant to seek information or statements from a counseled defendant about the case for which the defendant has counsel (*Massiah v. United States* 1964, 204–206; *Maine v. Moulton* 1985, 176). But the right to counsel is not violated if the police use an informant to obtain information about another offense for which no charges have been filed (*Illinois v. Perkins* 1990, 299).

Another area of Sixth Amendment controversy concerns the right to counsel when a defendant's only source of funds for paying a lawyer is the proceeds of the alleged criminal activity. Many criminal statutes provide for forfeiture of funds derived from criminal activity. In 1989 the Supreme Court held that such funds may be forfeited at the outset of a case even if the forfeiture prevents a defendant from hiring counsel of his or her choice and remits him or her to a court-appointed attorney. The court stated that the Sixth Amendment right to "Assistance of Counsel" guarantees defendants in criminal cases "the right to adequate representation, but those who do not have the means to hire their own lawyers have no cognizable complaint so long as they are adequately represented by attorneys appointed by the courts" (*Caplin and Drysdale, Chartered v. United States* 1989, 624). As long as there is probable cause to believe that a defendant's assets are forfeitable, they may be frozen by court order as soon as he or she is charged (*United States v. Monsanto* 1989, 611–614). Moreover, if a court is concerned that a defendant's counsel has or may have a conflict of interest, the court may reject a defendant's proposed waiver of the conflict of interest and deny the defendant his or her choice of counsel (*Wheat v. United States* 1988, 163).

Exclusionary rule

As a presumed deterrent to government violations of the Constitution, a judicially crafted exclusionary rule provides that evidence obtained through most (not all) violations of the Fourth, Fifth, or Sixth Amendments cannot be used by the prosecution in a criminal trial. Not only is evidence seized in violation of the Fourth Amendment excluded from use at trial; evidence that is later obtained by exploitation of a Fourth Amendment violation is also excluded (*Wong Sun v. United States* 1963, 488). Statements obtained during in-custody interrogation without *Miranda* warnings are also inadmissible in a prosecutor's principal evidence at trial. However, if a suspect is interrogated without *Miranda* warnings and the un-warned statements lead the police to other evidence, that evidence is not subject to exclusion

even though the unconstitutionally obtained statements led to its discovery (*United States v. Patane* 2004, 637).

There are numerous exceptions to this exclusionary rule. These are generally based on a precept that exclusion of evidence in certain contexts would not be a strong deterrent to the constitutional violation at issue. For instance, confessions obtained in violation of *Miranda* may be used to cross-examine a defendant who elects to testify. Because the principal need for a confession is in a prosecutor's case in chief, "sufficient deterrence" is achieved by excluding unwarned confessions only from a prosecutor's direct case. The Supreme Court majority also expressed the view that un-warned confessions should be available for the purpose of avoiding "perjury" by testifying defendants (*Harris v. New York* 1971, 224–225). However, at least one state court, applying a state constitution, has ruled that an illegally obtained confession may not be used to cross-examine a testifying defendant in a criminal case (*State v. Santiago* 1971).

The court has also held that the government may use illegally obtained evidence to refresh a witness's memory (*United States v. Kusek* 1988, 949); at a defendant's sentencing hearing (*United States v. Nichols* 2006, 441); in grand jury proceedings (*United States v. Calandra* 1974, 349–354); in habeas corpus proceedings (*Stone v. Powell* 1976, 489–495); in civil deportation proceedings (*I.N.S. v. Lopez-Mendoza* 1984, 1042–1051); and in parole revocation proceedings (*Pennsylvania Bd. of Probation and Parole v. Scott* 1998, 363–369).

In *United States v. Leon* (1984, 920), decided in 1984, the Supreme Court added a "good faith exception" to the exclusionary rule. It held that evidence obtained through objective good faith reliance by law enforcement agents on a facially valid search warrant that is later found to lack probable cause need not be suppressed. The good faith exception also applies when police obtain evidence (1) in reliance on a warrant later found to be technically defective (*Massachusetts v. Sheppard* 1984, 991); (2) in reliance on a statute authorizing warrantless searches that is later declared unconstitutional (*Illinois v. Krull* 1987, 349–350); (3) in reliance on a police record that erroneously indicates the existence of an outstanding arrest warrant for an individual (*Arizona v. Evans* 1995, 13–16); or (4) in reliance on a mistaken but reasonable assumption that the conduct forming the basis for a *Terry* stop violated the law (*Heien v. North Carolina* 2014).

Furthermore, even when law enforcement conduct is held to be unconstitutional under newly announced doctrines, the exclusionary rule is only applied prospectively. The Supreme Court has held that "if the law enforcement officers reasonably believed in good faith that evidence they had seized was admissible at trial, the imperative of judicial integrity is not offended by the introduction into evidence of that material even if decisions subsequent to the search or seizure have broadened the exclusionary rule to encompass evidence seized in that manner." The court also observed that retroactive application of the exclusionary rule would not serve to deter predecision violations (*United States v. Peltier* 1975, 537, 541).

However, the good faith exception does not apply where a law enforcement agent does not have reasonable grounds for believing that a search or arrest warrant was properly issued (*United States v. Leon*, 922–923). The Supreme Court has specifically identified four situations where police reliance on a warrant is not objectively reasonable:

1. When the warrant was issued in reliance on a deliberately or recklessly false affidavit of a law enforcement agent (*Franks v. Delaware* 1978, 155–156)
2. When the magistrate issuing the warrant failed to act in a neutral and detached manner, e.g., by participating in the search after issuing the warrant (*Lo-Ji Sales, Inc. v. New York* 1979, 326–328)
3. When the warrant was based on an affidavit "so lacking in indicia of probable cause as to render official belief in its existence entirely unreasonable"
4. When the warrant was so facially deficient that an officer could not reasonably have believed it to be valid (*United States v. Leon* 1984, 923)

Another exception to the exclusionary rule is attenuation. A court may admit evidence that would not have been discovered but for official misconduct if the causal connection between the illegal conduct and the acquisition of the evidence is sufficiently attenuated to purge the evidence of its taint (*Wong Sun v. United States* 1963, 488). The Supreme Court has set forth three factors for courts to consider in determining whether the causal chain has been sufficiently attenuated: (1) the time elapsed between the illegality and the acquisition of the evidence; (2) the presence of intervening circumstances; and (3) the purpose and flagrancy of the official misconduct (*Brown v. Illinois* 1975, 603). Similarly, even if police engage in illegal activity, evidence is admissible if it is discovered through a source independent of the illegality, or if the evidence inevitably would have been discovered through independent, constitutional means (*Murray v. United States* 1988, 537).

Speedy trial rights

The constitutional contours of the Sixth Amendment right to a speedy trial are exceptionally vague. Many factors go into a balancing test. A 5-year delay was not a denial of the speedy trial right where the prosecution had adequate justification for some of the delay, the defendant acquiesced in more than 10 trial continuances and quite clearly did not want a speedy trial, and no prejudice from the 5-year delay could be identified (*Barker v. Wingo* 1972, 533–536). On the other hand, an 8-1/2 year delay in bringing a defendant to trial was too long where the government's "egregious persistence in failing to prosecute" for six of those years was responsible for the delay (*Doggett v. United States* 1992, 657).

When there is a speedy trial violation, the only remedy is dismissal of the charges. As a result, the speedy trial statutes

that have been enacted to provide some specificity in this area contain many grounds for excusing trial delay. Of interest here is that most of the state speedy trial statutes, as well as the federal speedy trial statute, specifically sanction trial delay in order to permit a psychiatric examination as to competency.

Theories of legal punishment and contemporary trends in sentencing

ROBERT LLOYD GOLDSTEIN AND ROGER J. BERNSTEIN

Well, I thought that modern penology has abandoned that rehabilitation thing, and they—they no longer call prisons reformatories or—or whatever, and punishment is the criterion now. Deserved punishment for crime.

Justice Antonin Scalia, during oral argument (*Miller v. Alabama* 2012)

In its function, the power to punish is not essentially different from that of curing or educating.

Michel Foucault (1975)

INTRODUCTION

Since the dawn of civilization, the institution of punishment has existed in every society. Over the centuries, philosophers and legal scholars have struggled to clarify the relationship between punishment and justice and attempted to justify the practice on both moral and rational grounds. The broad purposes of the criminal law are to prevent certain undesirable conduct and thereby protect the interests of society; it is framed in terms of imposing punishment for undesirable conduct (Bedau and Kelly 2010). When punishment is imposed by English-speaking courts, it is referred to as *sentencing*. In criminal cases, the state is the complaining party, "the initiating and enforcing agent" (Murphy and Coleman 1990), in contrast to cases in private or civil law, in which individuals seek redress for harm. In criminal cases, the state views itself as the injured party and, in order to protect the public interest, may choose to prosecute crimes even in cases where the victim prefers not to press charges. A discussion of why certain classes of acts are criminalized in order to prevent seriously harmful conduct, whereas other acts, perhaps equally harmful, are regarded as the province of civil law (e.g., tort actions providing for the award of monetary damages), is beyond the scope of this chapter and has been analyzed elsewhere (Simons 2008).

According to Hart (1968), the shared conception of punishment is defined in terms of five elements:

1. It must involve pain or other consequences normally considered unpleasant (e.g., incarceration).
2. It must be for an offense against legal rules.
3. It must be of an actual or supposed offender for his or her offense.
4. It must be intentionally administered by human beings other than the offender.
5. It must be imposed and administered by an authority constituted by a legal system against which the offense is committed (Hart 1968).

A society may be said to have an *institution of legal punishment* if it satisfies three conditions: (1) a set of criminal laws; (2) a procedure for determining who shall be punished as a way of enforcing the laws; and (3) an authoritative social mechanism for imposing the punishment (Golding 1975).

There are a number of rival theories of punishment, each with its enthusiastic adherents and critics, namely, Retributivism, Deterrence, Incapacitation, and Rehabilitation. Courts imposing sentences rely on a combination of these traditions, sometimes choosing that objective most likely to be achieved.

RETRIBUTIVISM

As Justice Scalia asserted, the retributive theory of punishment justifies legal punishment as just punishment for

moral desert. "[D]oing justice [is] punishing offenders for the crimes they commit" (Robinson and Darley 1997). The equation *justice = retribution* has become axiomatic: that justice is giving offenders what they deserve in consequence of their deserts (Moore 2010). "[N]owadays, retributivism has arguably taken the lead as *the* justification of punishment among academics and—maybe more importantly—policymakers, and punishment is acknowledged to be an inherently retributive process" (Materni 2013, 265).

Immanuel Kant is regarded as the Father of Retributivism, the first to set forth a systematic philosophical rationale for the practice. In 1797, Kant promulgated an *absolute* concept of justice, asserting that "the penal law is a *categorical imperative*." Kant's measure of justice is the *lex talionis* ("the eye for an eye" principle), meaning that lawful retaliation is that in which the correct punishment corresponds in kind and degree to the wrong suffered. In Kant's world, in every case in which a crime has been committed, punishment *must be imposed* and the punishment *must fit the crime*. Accordingly, "whoever has committed Murder must die" (Kant 1965, 102). Kant provides the following hypothetical to emphasize society's duty to exact retribution:

> Even if civil society were to dissolve itself by common agreement of all its members (for example, if the people inhabiting an island decided to separate and disperse themselves around the world), the last murderer remaining in prison must be executed, so that everyone will duly receive what his actions are worth and so that the bloodguilt thereof will not be fixed on the people because they failed to insist on carrying out the punishment; for if they fail to do so, they may be regarded as accomplices in this public violation of legal justice. (Kant 1965 [trans.], 102)

According to Kant, this equalizing standard (when offense and punishment stand in equal relationship to each other) balances the cosmic scale, restores the moral balance to equilibrium, and vindicates justice. Failure to punish the culprit is an *unthinkable violation* of the duty of justice, and Kant warns that "If legal justice perishes, then it is no longer worthwhile for men to remain on this earth" (1965, 100).

Retributivism is said to differ from mere revenge or vindictiveness, in that the latter are personal responses to criminal wrongdoing, sometimes of an extralegal nature. Retribution, on the other hand, is based on a respect for the law and on a "cluster of moral concepts: rights, desert, merit, moral responsibility, and justice" (Murphy and Coleman 1990, 121). Retributive punishment signifies a condemnatory attitude expressed toward the guilty offender: the criminal is an enemy of society and the imposition of punishment is, according to Lord Denning, "the emphatic denunciation by the community of a crime" (Hart 1968, 2).

Critics of retributivism contend that the inconvenient truth is, it is no more than vengeance in disguise—*public vengeance* at the hands of the state (Dolinko 1992). It may be true that satisfying the public desire for vengeance—calling it "justice" and establishing institutions to achieve such justice—may at bottom reflect our instinctual, atavistic drive for revenge. It has been argued that the instinct of an injured party to take revenge played a significant role in creating the customary norms in early societies and served as the foundation of norms that underlie the institutions of criminal and civil law of more complex societies (Elliott 1985). This line of reasoning is supported by hypotheses based on the findings of experimental and evolutionary psychologists that we as a species are "hardwired to react punitively to crime…and natural selection has favored human beings with that hardwiring…Individuals with clear senses of right and wrong and a willingness to act on them…are better community members, fostering cohesion, increasing the odds of community survival, and perpetuating the gene pool that predisposed people to be retributive" (Tonry 2011, 8).

DETERRENCE

The utilitarian penologists (in a tradition extending from Plato and Protagoras to Beccaria, Bentham, and Mill) view deterrence as the paramount justification for legal punishment. According to this theory of punishment, members of a society are deterred from the commission of proscribed acts because of the possible consequences (i.e., the threat of punishment or the execution of punishment) that the criminal law mandates. This is a *forward-looking* theory (as opposed to the *backward-looking* rationale for criminal punishment of Retributivism), which rests on the empirical premise that the threat of punishment or its actual imposition in a particular case serves as an effective deterrent to others. The evil of punishment is justified, therefore, because it leads to the greater overall good of society by preventing future criminal behavior. Plato stated the "classical" theory of deterrence around 2400 years ago:

> Punishment is not retribution for a past wrong. What has been done cannot be undone; it is for the sake of the future and to secure that both the person punished and those who see him punished may either learn to detest the crime utterly or at any rate to abate much of their old behavior. (Plato 1975 [trans.], 934)

According to the utilitarian approach of Bentham (1961), the chief end of punishment is *general deterrence*—that is, the imposition of punishment on the offender promotes the greater good of deterring other members of society from committing similar acts, thereby resulting in an overall reduction of crime. Bentham sets forth a cost–benefit analysis to decide which acts need to be criminalized and to calculate the optimal amount of punishment for specific offenses (in order to satisfy utilitarian considerations of

promoting the overall safety and happiness of society, the common good shared among the greatest number), which is necessary to prevent criminal activity at the "cheapest rate possible" (Golding 1975). Bentham's calculus serves to arrive at a balance where overall social benefits outweigh social costs, resulting in a net social gain.

Specific Deterrence refers to a related aim of criminal punishment: to deter the criminal himself or herself (rather than to deter others) from committing future offenses. (It goes without saying that in the event the criminal is executed, the punishment would be absolutely effective in deterring him or her from the commission of future crimes.) This is the basis of a famous gallows humor quip in a cartoon depicting the prisoner addressing the hangman: "This is certainly going to be a lesson to me!" The effectiveness of general deterrence has never been proven and "[f]or many convicted offenders—maybe even for most—however, prison ends up being a 'school of specialization in crime,' and the prison door turns out to be a revolving door. Thus, current prison practice casts serious doubts on the personal deterrence effect of criminal punishment" (Materni 2013, 291). Unsurprisingly, Kant rejected the deterrence theory categorically: "Judicial punishment can never be used merely as a means to promote some other good for the criminal himself or for society, but instead it must in all cases be imposed on a person on the ground that he has committed a crime" (Kant 1965, 102).

INCAPACITATION AND REHABILITATION

When criminals are deprived of their liberty and are isolated from society, they lose the capacity to commit further crimes against society. The mainstay of the system, incarceration, *incapacitates* the offenders and, if nothing else, protects the public from the crimes they would commit were they free to do so. The protective efficacy of incapacitation seems obvious. However, it has been strenuously argued by some scholars (Robinson and Darley 1997) that moral desert should be the *sine qua non* for the infliction of criminal punishment on the offender. In other words, "[w]e *need* to practice incapacitation. But we also *need* a criminal justice system which punishes people *for having done 'something bad'*" (Materni 2013, 300). Adoption of a purely utilitarian approach, taken to its logical conclusions in order to protect society, poses the danger of a slippery slope of unlimited preventive detention (beyond the completion of their sentence) of all individuals considered to be at risk of committing future crimes. In this regard, we have already witnessed the continuing controversy generated by laws that enable the post-sentence preventive detention of "dangerous" sex offenders, which raises difficult constitutional and human rights issues. A discussion of this topic is well beyond the scope of this chapter and is analyzed elsewhere (Cucolo and Perlin 2013).

The final theory of punishment is Rehabilitation. Many commentators believe that there has been a loss of faith in the scientific and philosophical rationale for making rehabilitation the paramount goal of sentencing (Wilson 2013). Rehabilitation aims to offer the offender effective therapeutic attention that would enable him or her to lead a more productive and successful life and be able to safely re-enter society without continuing to pose a threat to the community. This approach is viewed with suspicion by some as a discredited paternalistic reform theory (Moore 2010); others reject it as an indiscriminate attempt to impose the psychiatric–medical model on a heterogeneous population of criminal offenders without regard for scientific, moral, or political considerations. The latter believe that the overwhelming consensus of research in this area has resulted in the undermining of virtually all of the enduring mythology regarding prior optimistic assessments of corrective efficacy (Walker 1991). However, the literature falls short of establishing that nothing works. "Nothing works" may be an overstatement. Compared to a recidivism rate of 50%–75% in the United States and Europe, the recidivism rate in Sweden, Denmark, and Finland is 30%, and only 20% in Norway (Hernu 2011). The Scandinavian model of rehabilitation (particularly in Norway) has shown promise. It has been described as promoting a "focus on human rights and respect" for inmates' dignity as human beings (Hernu 2011; W.W. 2011). Another promising success attained through rehabilitation programs, with a corresponding reduction in the recidivism rate, has been reported in India's prison system (Bedi 2007).

LEGISLATIVE AND JUDICIAL APPROACHES TO PUNISHMENT

The major theories of criminal sentencing have had varying levels of influence on legislators and judges, and empirical research has rarely played a significant role. Rehabilitation was a dominant penological goal from the late nineteenth century until the last quarter of the twentieth century. During this period the "indeterminate" model of criminal sentencing was dominant. In the last 30 years rehabilitation and indeterminate sentences have been abandoned, and crime prevention and incapacitation have dominated criminal justice policy. To meet these goals, there has been a sharp increase in the use of rigid sentencing formulas and very long prison sentences. Sentences of life imprisonment are now imposed for noncapital crimes such as trafficking substantial quantities of narcotics. At the same time, however, the U.S. Supreme Court has begun to ameliorate highly punitive sentences imposed on juveniles in capital and noncapital cases.

Transition from indeterminate sentencing to determinate sentences

The indeterminate model of criminal sentencing was adopted in many jurisdictions in the time period between 1870 and 1910, and prevailed throughout the United States by 1950. In indeterminate sentencing a judge imposes a sentence consisting of the range of years set forth in the

applicable statute, e.g., 8 to 25 years. A parole board is given wide discretion to determine when, after the minimum time is served, the convicted person will be paroled from prison. Rehabilitation is the principal premise of indeterminate sentencing, and the parole board is supposed to be guided by "prisoner reformation" (*Dreyer v. State* 1902).

A variation of this model prevailed in the federal system until 1987. Prior to 1987 federal criminal statutes also authorized sentencing within a broad range of years, but gave federal judges wide discretion to determine a specific sentence anywhere within that range. As a result, judges could decide for themselves the goals to be sought in each sentence. Some federal judges focused on rehabilitation, while others focused on "just deserts." Under this system different offenders could receive widely varying sentences for substantially the same criminal offense. Yet after the length of a prison sentence was set by the federal judge, the U.S. Parole Commission still had discretion to release an offender at any time after the offender had served at least one-third of the sentence that was initially imposed (*Mistretta v. United States* 1989). As a result a large number of sentenced federal prisoners actually served no more than a third of the judicially imposed sentence.

Indeterminate sentencing remained prevalent until the 1970s or 1980s, depending on the jurisdiction. Beginning in the 1970s public attention to significantly elevated crime levels and increasing drug use led to a perception that the indeterminate sentencing model was too lenient. Congress concluded that federal judges exercised too much discretion in sentencing, resulting in unacceptable sentencing disparities for the same offense as well as in sentences that were considered unacceptably low. The result was a transition to a determinate sentencing model that took discretion away from federal judges and eliminated parole in the federal sentencing system. As a result, the U.S. Parole Commission could no longer determine the actual amount of time served following the imposition of sentence. Reductions in prison time for good behavior were also minimized. These changes were intended to achieve a "truth in sentencing" system for federal sentences in which prisoners served out the actual sentence that the court imposed (less a small allowance for good behavior). The theoretical justifications for abandoning indeterminate sentencing in favor of determinate sentences were grounded in the punitive ideologies of retribution, incapacitation, and/or just deserts, together with the general belief that indeterminate sentencing had failed to control crime (Doherty 2013).

To cabin judicial sentencing discretion, Congress enacted a "Sentencing Reform Act" in 1984 that became effective for crimes committed after November 1, 1987. Under this legislation all federal sentences are to be determined by "Sentencing Guidelines" that assign a numerical "base offense level" to each kind of offense. The offense level is increased on a systematic basis for more serious iterations of an offense to derive a "total offense level." In practice the determination of the seriousness of an offense in a nationwide court system could only be accomplished by using a quantitative measure for offense severity. Therefore, the length of federal sentences is governed almost entirely by quantitative measures, such as the overall quantity of drugs in a narcotics distribution operation or the total amount of money lost in a Ponzi scheme or investment fraud. The theory is that the quantitative characteristics of a crime are the best way to measure the crime's severity and reduce sentencing disparities.

Prior convictions also increase the severity of a sentence according to a table, with greater weight given to prior felonies than to prior misdemeanors. The premise is that a lengthier criminal history best identifies those offenders who are mostly likely to recidivate. In this system an offender's actual role in an offense, no matter how minimal, may lower the offense level only a small amount. As a result, a minor player in a large narcotics operation that imports large drug quantities can receive a prison sentence of 30 years or even life imprisonment despite the minor role.

Once the "total offense level" for a given case is computed and the defendant's criminal history is ascertained, a narrow sentencing range, often no more than 6 months, is determined by using a nationally applicable sentencing table. This is a grid on which the "total offense level" increases on the vertical axis and criminal history severity increases on the horizontal axis. The intersection of the total offense level and criminal history in this table determines the sentencing range, which is often as little as 6 months. The judge's role is limited to deciding what sentence to impose within this narrow range (U.S. Sentencing Commission 2015). Judges may depart from the grid-determined sentence and grant a lower or higher sentence only in highly atypical circumstances (e.g., significantly diminished mental capacity or very unusual family circumstances). In practice the principal method of obtaining a sentence lower than the mathematically determined one has been to provide accomplice testimony to assist the government in prosecuting other offenders.

As noted, Congress gave this highly determinate federal sentencing model the Orwellian title of "Sentencing Guidelines." In 2005 the Supreme Court, responding to widespread dissatisfaction with the rigidity of this system, found the "Sentencing Guidelines" to be unconstitutional and decreed the federal Sentencing Guidelines to be "advisory" instead of mandatory (*United States v. Booker* 2005). In practice, as of this writing there are relatively few federal judges who vary their sentences far from the narrow sentencing ranges that are mathematically prescribed in the "Guidelines."

Similar sentencing models based on a sentencing table that measures offense severity and prior criminal record quantitatively have been adopted in 21 states. Only in a few of these 21 states is the application of the sentencing table sentencing range mandatory. In most states the sentencing table result is advisory, and in some it indicates a presumptive sentence. In most of the states that employ a sentencing table the judges retain significantly more discretion than federal judges have under the federal Sentencing Guidelines.

Substantial increases in criminal penalties

Concurrently with the transition to determinate sentencing, federal—and state—prison sentences have increased sharply in length since the federal "Sentencing Guidelines" were adopted. The principal reason is the shift in sentencing objectives away from rehabilitation and toward punishment, deterrence, and incapacitation.

The "War on Drugs" commenced by President Nixon in 1971 began a series of increases in sentence length in narcotics cases that culminated in Congressional adoption of extremely long narcotics sentences in the 1980s. Under current law the maximum statutory penalty even for relatively small amounts of narcotics is a 20-year prison term. Larger quantities of narcotics (whether possessed by a defendant or only by co-conspirators) carry a mandatory minimum sentence of 10 years and a maximum sentence of life imprisonment. Prosecutors have discretion to double these mandatory minimum sentences for a second felony narcotics trafficking offense. At the same time, the offense levels in the Sentencing Guidelines for narcotics offenses were set so that they would be parallel to the major increase in the severity of statutory narcotics penalties. Under the Sentencing Guidelines the offense levels for major narcotics crimes can result in a life sentence or in a sentence that is decades long, with practically no discretion available to federal judges to depart from these sentencing outcomes.

States also increased sentences for narcotics offenses as part of the "War on Drugs." In New York, for example, the mandatory penalty for sale of more than 2 ounces of cocaine or heroin was set at 15 years to life in prison in 1973. The quantities of drugs sold in the United States did not diminish after narcotics sentences were lengthened.

The most dramatic illustration of the sharp increase in criminal penalties is contained in the 1994 Federal Death Penalty Act. This statute created 60 new death penalty offenses under 41 federal statutes. As a result, a federal death penalty is now authorized for offenses that were previously subject only to state law, such as murder for hire, fatal drive-by shootings, sexual abuse crimes resulting in death, car-jacking resulting in death, and certain crimes not generally resulting in death such as the running of a large-scale drug enterprise (Capital Punishment in Context 2015). In practice, federal prosecutors, who are often aware of the public's reservations about the death penalty, have almost never sought the death penalty under these statutes. These statutes are essentially irrelevant to the administration of the death penalty in practice.

Responding to a view that punishments for white-collar crime were too low, for example, the "offense levels" for financial crimes were calculated so that they can readily result in a prison sentence for offenses involving a loss no greater than $30,000. The offense levels for financial crimes will almost always result in a prison sentence for fraud or embezzlement offenses involving losses greater than $400,000.

Habitual offender statutes

The length of prison sentences has also been dramatically increased since the 1970s by the adoption of habitual offender provisions in many state and federal statutes. A prominent example is the "three strikes and you're out" law adopted by referendum in California in 1994. In California a third felony conviction for any type of crime will automatically result in a prison sentence of 25 years to life. Faced with overflowing prisons, California amended this statute in 2012 so that a third conviction does not result in an automatic 25-year-to-life sentence, unless the third conviction is for a "serious or violent" felony. However, in a number of instances prosecutors can manipulate this system by electing to charge virtually the same offense either as a misdemeanor or as a felony, with the result that a prosecutor can control whether or not the "three strikes" law will apply simply by making a different charging decision (*Ramirez v. Castro* 2004).

Some 25 other states have habitual offender statutes that can result in long automatic sentences for successive convictions. These laws vary from state to state, primarily with respect to the seriousness of the predicate offenses. Most other states have less draconian habitual offender provisions than California. For instance, in Maryland only violent felony convictions are considered, and an automatic sentence of life imprisonment is only imposed in the event of a fourth violent felony conviction. In the federal system, beginning in 1987, two felony convictions in unrelated cases involving either a crime of violence or a narcotics offense will result in "career offender" status. That status requires a sentence of no less than 15 years and as high as life imprisonment, depending on the severity of the third offense.

The proponents of "three strikes and you're out" laws contend that a potential offender who knows that another arrest and conviction will automatically result in imprisonment for 25 years to life will avoid committing another offense to avoid such punishment. Whether or not there has been any deterrent effect is, of course, extremely difficult for social science to ascertain. Proponents of these statutes take the view that recidivism is unavoidable and lengthy incapacitation is necessary, despite the well-established correlation between increased age and lower recidivism rates.

Reaction to current sentencing regimes

Beginning around 2010, the vastly increased expense of providing prisons for a burgeoning corrections population, and the resulting state budgetary strains, has caused some re-thinking of highly punitive criminal sentencing policies, primarily in the states. A number of states have repealed mandatory minimum sentences for narcotics crimes and have begun to emphasize rehabilitation as a method of reducing overall corrections spending. In New York, for example, legislation passed in 2005 eliminated maximum life sentences for most drug offenses and

lowered mandatory minimum sentences. Mandatory minimum sentences for some narcotics offenses were removed in 2009 and nonincarceration treatment alternatives were authorized (New York Division of Criminal Justice 2014). This transition is still in its infancy. Although "mass incarceration" has become a subject of political discourse in the 2016 presidential election campaign, very little change has taken place at the federal level, where budgetary concerns are less immediate. The only shift so far at the federal level is a slight amelioration of the narcotics guidelines for nonviolent offenders, and an increased willingness to consider executive clemency for prisoners serving long sentences for nonviolent crimes (usually narcotics offenses).

Juvenile offender sentencing

A small group of ground-breaking Supreme Court cases that draw extensively on psychological research about juvenile brain development have begun to cause significant changes in juvenile sentencing policy. The decisions in these juvenile sentencing cases—which have been decided by only the narrowest majorities of the court—run counter to the punitive philosophy that currently dominates sentencing of adult offenders.

In 2005 the Supreme Court held that the Eighth Amendment prohibition against cruel and unusual punishment barred capital punishment for children who had committed a capital crime while younger than 18 years of age (*Roper v. Simpson* 2005). It noted that "a lack of maturity and an underdeveloped sense of responsibility are found in youth more often than in adults and are more understandable among the young. These qualities often result in impetuous and ill-considered actions and decisions." The court also observed that juveniles "are more vulnerable or susceptible to negative influences and outside pressures, including peer pressure." And the court pointed out that the United States was the only country in the world that still imposed the death penalty on juvenile offenders. For these reasons, among others, the court concluded that sentencing a juvenile offender to death violated the Eighth Amendment.

In 2008 the Supreme Court held that imposing the death penalty on an adult offender for a nonhomicide crime violates the Eighth Amendment (*Kennedy v. Louisiana* 2008). Two years later, the court ruled that the Eighth Amendment prohibits imposition of a sentence of life without parole on a juvenile offender who did not commit a homicide offense (*Graham v. Florida* 2010). The court rejected the notion that a juvenile offender could be deemed incorrigible and bound to recidivate. It noted: "It is difficult even for expert psychologists to differentiate between the juvenile offender whose crime reflects unfortunate yet transient immaturity, and the rare juvenile offender whose crime reflects irreparable corruption." And the court again noted the comparative immaturity of juvenile offenders. It stated that "developments in psychology and brain science continue to show fundamental differences between juvenile and adult minds"—for example, in "parts of the brain involved in behavior control."

In 2012 the Supreme Court held that a mandatory sentence of life imprisonment without parole could not be imposed on a juvenile who committed a capital offense (*Miller v. Alabama* 2012). The court's reasoning built on the prior cases. First, the court held that the same "developments in psychology and brain science" that it had cited in 2010 as showing lack of neurological development required it to recognize the diminished culpability of juveniles in homicide and nonhomicide offenses alike. It reiterated its earlier conclusion that "transient rashness, proclivity for risk, and inability to assess consequences—both lessened a child's 'moral culpability' and enhanced the prospect that, as the years go by and neurological development occurs, his deficiencies will be reformed." The court also observed that "[l]ife without parole forswears altogether the rehabilitative ideal." It held that "[i]mprisoning an offender until he dies alters the remainder of his life by a forfeiture that is irrevocable."

Although mandatory sentences of life without parole are now unconstitutional, courts retain discretion to impose a sentence as long as life without parole on a juvenile offender who commits a capital offense. But a judge or jury must now have the opportunity to consider mitigating circumstances, specifically including immaturity, before imposing the harshest possible penalty of a sentence of life without parole on a juvenile offender. A state must now provide a juvenile offender with "some meaningful opportunity to obtain release based on demonstrated maturity and rehabilitation." Unfortunately, the Supreme Court has not yet decided whether this precept requires reconsideration at some later point (by either a parole board or a court) of a discretionary decision to sentence a juvenile offender to life imprisonment without parole.

There are thousands of juvenile offenders in the United States who are currently serving a sentence imposed of life without any possibility of parole (Amnesty International 2005; The Sentencing Project 2014). To date some state courts have held that retroactivity requires re-sentencing of juveniles who are serving a life sentence without parole (*Jones v. State* 2013; *Falcon v. State* 2015). Other states have rejected retroactive re-sentencing of juvenile offenders who have been earlier sentenced to life imprisonment without parole (*People v. Carp* 2014). A number of states have enacted laws requiring that sentences of not less than 25 years, 35 years, or even 40 years without parole be imposed on juvenile offenders in homicide cases. A lengthy minimum sentence without parole for a crime committed while a juvenile is arguably unconstitutional because of the psychological immaturity of juvenile offenders that the Supreme Court has now recognized.

Forensic research on the Internet

PETER ASH AND PAUL J. O'LEARY

INTRODUCTION

The explosion of information on the Internet over the past several decades has changed how we get information. The types of information most relevant to the practice of forensic psychiatry include

- Legal documents such as statutes and court opinions
- Secondary source information, such as commentary on legal cases
- General information that may be relevant to a specific case
- Collateral information about an evaluee
- Information about the forensic psychiatrist that may be used by others

The advent of the smartphone has also increased the ways in which we obtain information. Previously, information on the web was available primarily on computers utilizing web browsers, but the advent of tablets and smartphones has brought with it a plethora of apps that assist in obtaining information.

OBTAINING LEGAL DOCUMENTS AND SECONDARY SOURCE INFORMATION ON THE WEB

Legal documents are highly suited to web presentation: government materials are public and not copyrighted, so anyone who wants to post or reference them is free to do so. Much legal material that was previously available only to those with fairly expensive subscriptions to such legal databases as Lexis or Westlaw, or to those who could physically travel to a law library, is now available to any forensic psychiatrist with an Internet connection or a smartphone.

Statutes of the federal government and all states are now available on the web, as well as a great deal of other regulatory and administrative material (the *Code of Federal Regulation*, manuals of civil and criminal procedure, treaties, etc.). One of the advantages of web information is that it is a fairly straightforward task to keep it up-to-date, so as new legislation is enacted or a new opinion is delivered, the addition is easily added to the existing body of information.

Court systems began to put appellate opinions on the web in the mid-1990s. The U.S. Supreme Court began its website in the year 2000, although a number of other sites had been posting selected Supreme Court opinions for several years prior to that. Most appellate decisions had previously only been available through pay sites such as Lexis and Westlaw, but currently most appellate decisions are available on the web for free.

A wide variety of secondary sources are also available. The federal government has done an excellent job posting government documents in a variety of fields, some of which are useful for forensic psychiatrists. For example, the publications of the U.S. Department of Justice, such as the FBI *Uniform Crime Reports* (UCR), are available. In addition, the federal government has put many of its databases online (e.g., the FBI *Uniform Crime Reports*, injury data, census data) together with tools to extract data of the user's specifications (see, for example, http://www.ucrdatatool.gov for extracting UCR data). Many legal periodicals and law reviews have moved to making the full text of all or some of their articles available for free, and the full text of all articles of the *Journal of the American Academy of Psychiatry and the Law* is available (http://www.jaapl.org). Finally, the characteristic of the web that anyone can publish information he or she finds interesting and/or wants to publicize leads to the posting of a great deal of information about forensic topics, from the American Psychiatric Association's position on capital punishment to militia sites containing instructions for small bomb construction.

GENERAL PRINCIPLES IN LOCATING WEB MATERIAL

With the improvement of search engines, finding material has become increasingly simple. Previously, one needed to pick search terms with great care. However, now using a general search engine such as Google, Yahoo, or Bing will

often get one to available material without having to search on legal or organization websites. Remarkably, a search on Google that includes the organization name and the information sought is often more efficient than entering the terms in the search box of the organization's website. This is true because Google's ranking of results pulls from a larger pool of searches, whereas on the organization site, the result ranking algorithms are often dependent on the keywords entered by the organization. Most users generally start a search with the words and terms they associate with their expected results, and frequently, scanning the first page of search results leads to what they want. The more the user puts in information specific to what is being searched for, the more likely one will retrieve the information sought. For legal cases, searching on the citation is generally the most efficient way to locate the case.

Narrowing a search

If the original search returns too many results, the use of search operators can be very helpful in narrowing the search. Some of the most commonly used operators for Google searches are listed in Table 96.1. Other search engines utilize similar operators.

Expanding a search

If a Google search does not provide the information being sought, there are numerous sites that specialize in pointing to information that is of use to forensic psychiatrists. Table 96.2 lists samples of some of the types of sites available.

SMARTPHONE APPS

Apps are application designed to run on smartphones and tablet computers. As of May 2015, Android users were able to choose between 1.5 million apps, and Apple's App Store contained 1.4 million available apps (statista.com 2015). Considering the number of available apps, and the rate new apps are created, rather than reviewing a number of specific apps, Table 96.3 provides information about some sites that review legally relevant apps.

Though we are not reviewing a number of legal apps, there are a few apps that bear mentioning because they appear on each of the site's lists. Table 96.4 lists these apps along with a summary of their purpose.

OBTAINING COLLATERAL INFORMATION ABOUT AN EVALUEE

Obtaining collateral information about a person being evaluated, which includes searching the Internet for publicly available information relevant to a case, is becoming a standard aspect of a forensic evaluation (Glancy et al. 2015, S10). Although it is clearly legal to conduct an Internet search about one's patients, there is some controversy about whether a therapist should do so, because knowing information about a patient that the patient has not communicated

Table 96.1 Refining a Google search query

Notation	Find result	Example
+term	Search includes the term. Common terms like "The, A, and" are excluded from the search unless specifically requested.	+The King
term1 OR term2	With term1 or term2 or both	Tahiti OR Hawaii
term1|term2	Both term1 and term2	Tahiti|Hawaii
term1 -term2	The minus sign in front of a term filters term2 out of the search results.	AAPL -apple
"term"	Using quotation marks around a phrase will require that particular word order.	"no sharper than that between twilight and dusk"
"term1 * term2"	An asterisk within quotes signifies a variable, allowing searches for unknown terms.	"cruel and unusual punishment * amendment"
term1 AROUND(n) term2	Searches for terms that are separated from each other by *n* or less words.	court AROUND(2) psychiatrist
term site:website	Searches for the term only in the specified website	Meeting site:aapl.org
inurl:term	Returns results with term in the URL of the site	inurl: NGRI
allinurl:term1 term2	Searches for sites with all search terms in the URL	allinurl: psychiatrist malpractice
term filetype:file extension	Searches for a Specify a type of document. Examples of common file extensions include: PDF: Portable Document Format PPT: PowerPoint DOC: Word Document	Medical Exam filetype: PPT

Note: The notation column show the generic notation to use, with *term* being the search term. The Find Result column explains the function of the notation.

Table 96.3 Sites that review law apps

Site summary	Site address
University of California, Los Angeles School of Law Library lists apps that focus on legal research and news. The site lists information about almost 70 current apps that might be of interest to law students and lawyers. However, it does not list them according to functionality.	*tinyurl.com/legalapps-ucla*
University of Wisconsin-Madison Law Library lists many of the same apps that might be of interest to law students and lawyers, and sorts the apps by functionality.	*tinyurl.com/legalapps-uw*
The American Bar website lists 10 apps for productive lawyers. The apps listed focus on the practice of law and courtroom aids.	*tinyurl.com/legalapps-AmBar*
The website LegalTechNews lists 12 apps for legal research, some of which are not listed on the other sites. The apps listed focus on the practice of law and courtroom aids.	*tinyurl.com/legalapps-LegTech*

Table 96.4 Selected well-reviewed legal apps

App name	Summary
Fastcase	Contains cases and statutes from all 50 states and from the federal government.
iSSRN	The Social Science Research Network is a resource for scholarly research in a number of disciplines, including law. With the iSSRN application, users may search more than 260,000 research papers in the SSRN library.
Black's Law Dictionary	The 10th edition contains more than 45,000 terms, alternate spellings or equivalent expressions for more than 5300 terms, and West key numbers. Hyperlinked cross-references make finding related terms quick and easy. Audio pronunciations for thousands of hard-to-say legal terms. Bookmark terms for quick reference. Featured Word of the Day.
ABA Journal	The app provides breaking legal news and articles featured in the ABA Journal.

to the therapist may feel to the patient like an intrusion of privacy and affect the therapeutic alliance (Gabbard et al. 2011; Kirschner et al. 2011; Kolmes and Taube 2014). However, in forensic evaluations, the role of the psychiatrist is not one of therapist, and there is no therapeutic alliance. If the evaluator is not aware of publicly available information, the thoroughness of his or her evaluation may be questioned. For example, consider an assessment of the mental state and intent of a defendant charged with a hate crime, and the evaluator is unaware of, and so did not take into account, the defendant's readily identifiable rants and threats on public Internet discussion sites.

The issue of an evaluator asking for access to nonpublic information on the web, such as asking an evaluee to provide access to an otherwise restricted Facebook page, is more problematic. Such material would ordinarily require a release from the evaluee, or having the retaining attorney obtain the information through the normal discovery processes.

Information obtained from a web search of an evaluee, like other collateral information, may be useful in a variety of ways, including either confirming or disconfirming evidence for what the evaluee reports in an interview. There are a variety of problems utilizing web search information. Recupero (2010) and Metzner and Ash (2010) have discussed strategies and problems involved in web searches for collateral information. These include searching at social media and blog sites in addition to general search engines. If the evaluee has a common name, a web search may reveal so many hits that it is difficult to hone in on the particular person. The famous New Yorker cartoon of two dogs looking at a computer monitor with the caption, "On the Internet, nobody knows you're a dog" (Steiner 1993), highlights the problem of the question of validity of information obtained from the web. Psychiatrists who are unfamiliar with social networking sites may have difficulty navigating those sites to search for information, may have little sense of what the norms are for posting, and may even have trouble deciphering the information itself. Scott and Temporini (2010) give an example of a text message exchange involving a 14-year-old boy, spacedude102, shortly before he committed suicide:

```
ohionetfin: whatup?
spacedude102: *) and :-Q~420
ohionetfin: :-0
spacedude102: #-)
ohionetfin: ?
spacedude102: :-C, want 8-#
```

An evaluator who is not familiar with emoticons and text abbreviations may not decipher that spacedude102 was saying that he was drunk [*)] and using marijuana [:-Q ~ 420], had partied all night [#-)], was extremely sad [:-C], and wanted death [8-#].

Digital evidence of a wide variety of sorts, including social media pages, text message and email exchanges, and logs of websites visited by the evaluee, has become quite common in litigation. Such material is typically provided by the retaining attorney, who may ask the forensic evaluator to interpret the information.

WEB INFORMATION ABOUT THE FORENSIC EVALUATOR

Information about the forensic psychiatrist is also readily available on the web, and it is common for evaluees and attorneys to Google forensic psychiatrists with whom they interact. Privacy is not what it used to be: not only are the postings and most publications of the psychiatrist available, but with a little investigation, such material as the psychiatrist's work history, ratings by patients, and approximate home value, is readily available. More diligent investigation, often purchased over the web relatively cheaply, will yield even more personal information. Attorneys in certain subspecialties may share materials including prior reports and deposition transcripts in restricted access sites. At a deposition, it is no longer rare to be confronted with, "But doctor, in a talk (or deposition or trial) you gave 6 years ago you said…" when a video or transcript of that talk has been uploaded to the web, or a summary of the talk was printed somewhere, or the expert has expressed an opinion on a bulletin board or in an Internet discussion group. Controversial experts may have negative information posted about them. Once material is on the web, it is very difficult to get it removed.

In order to deal effectively with this lack of privacy, a forensic psychiatrist is well advised to Google himself or herself with some regularity to keep abreast of what material is on the web. Professionals do change their opinions and views, and it is useful to know what changes are documented on the web or in testimony transcripts so the expert can anticipate what questions might be asked during testimony. The psychiatrist should also recall that he or she is not responsible for remembering everything he or she ever did: when being cross-examined by an attorney who appears to be relying on some web source, it is appropriate to ask to see the source, both to refresh the psychiatrist's memory, as well as to verify that the source is accurate, and the behavior being questioned actually occurred and is not being taken out of context.

FURTHER READING

As might be expected given the rapid rate of evolution of the web, it is hard for books that discuss legal research on the web to stay up to date. Those that have been published tend to go out of print quite rapidly. The most useful material is placed on the web itself, and revised or removed as technology changes. At the time of this writing, Googling the phrase "legal research on the internet" brought up 71,000 hits.

Introduction: The case for landmark cases

MERRILL ROTTER AND HOWARD FORMAN

The cases that follow in this section are the landmark cases in forensic psychiatry. Most if not all of them will have been referenced and perhaps described in prior chapters. For example, the chapter on civil commitment would not be complete without noting the importance of such precedents as *Lessard v. Schmidt* and *O'Connor v. Donaldson*. The holdings in those cases are critical to both the understanding of involuntary commitment and implementing appropriate dispositions for patients. However, Landmark Cases hold more than holdings. Landmark Cases have intrinsic importance as an eye into the evolution of thinking about individual rights, theories of mental illness, views of psychiatric treatment, and public policy toward children and adults, rich and poor, those with and without mental illness, and/or histories of negligent, discrimination, or criminal behavior. Studying the specific facts of a case and the legal reasoning associated with a particular holding illuminates these social, clinical, ethical, and legal considerations in a way not possible through a limited review of the principle or precedent stands for which it is known (Appelbaum 1994).

Furthermore, it is our belief that forensic practice is enhanced when one understands how the law thinks in general. Broad considerations of federalism, activism, states' rights, and conservative vs. liberal ideology may all be mined from cases in which the narrow starting point is mental illness. In fact, Landmark Cases are often cited for reasons other than the narrow, forensic psychiatric-related holding.

As an example, consider the case of *Robinson v. California,* 370 U.S. 660 (1962) where Mr. Robinson was found guilty of a misdemeanor for violating California Health and Safety Code §11550 which criminalized addiction. The Supreme Court overturned this conviction through a majority opinion that held punishment for the status of having a disease violated the Eighth Amendment's prohibition on cruel and unusual punishment. *Robinson* is most famously compared and contrasted by the justices in *Powell v. Texas*, 392 U.S. 514 (1968). In *Powell,* the homeless defendant argued that he was being punished for a "status" crime like *Robinson* when he was arrested for being publicly intoxicated because he claimed (likely legitimately) that he was a "chronic alcoholic." The court did not change course and overturn its *Robinson* prohibition of punishing a status crime, but rather, decided that *Powell* was fundamentally a different situation. Although both defendants may be addicts, Powell was being punished for public intoxication, *actus reas,* not his status of being an alcoholic.

Robinson's impact though goes far beyond one decision in a case with a similar fact pattern. One can find *Robinson* cited in later landmark cases in supporting the application of the Eighth Amendment to the states through the Fourteenth Amendment in a child abuse case (*Deshaney v. Winnebago County Department of Social Services*, 489 U.S. 189), the justification for civil versus criminal confinement with reference to a debate about post-insanity acquittal procedures (*Foucha v. Louisiana*, 504 U.S. 71, 1992), and the need for proportionality between offense and punishment with reference to the death penalty (*Atkins v. Georgia*, 536 U.S. 304, 2002). *Robinson* is only one such example.

It is beyond the scope of this introduction and section to delineate the myriad streams of interpretation, citation, and interconnection. In the section that follows we blended a topic-by-topic based division, but within each topic the cases are organized chronologically to demonstrate the advance (or occasionally regression, perhaps) of the legal reasoning in that particular domain. This allows the reader to efficiently educate himself or herself on what the law is, and provides a historical perspective to see how it arrived to its current state. Although we have strived for coherent categorizations, many cases could belong in more than one chapter. *State v. Andring*, for example, is as much a case involving child abuse as it is about confidentiality, and thus could be placed within either case grouping. The categorization in this section maintains continuity with prior editions of this text. For reference purposes, we have included the official landmark case list collated by the American Academy of Psychiatry and the Law, with its somewhat differing divisions. Several of the more recent death penalty cases have not been included in this section, given their comprehensive review elsewhere in the book.

As noted above, there is no replacement for reading the actual court opinions themselves, so the authors have strived to give the reader something more than a list of skeletal takeaways. Each summary includes the information that is relevant, including who are the parties involved, the history of the case itself, the facts of the case (which surprisingly are often not under dispute), the constitutional or legal codes being weighed, the questions the court addressed, and often just as importantly, the questions not addressed, the scope of the ruling, and its applications. In certain cases, the dissenting opinions that hold no legal weight but can be brilliant and critical of the majority opinion will be commented upon. The authors hope that the summaries that follow will spark an interest to delve more deeply into the cases.

Civil, juvenile justice and family law cases

MERYL B. ROME AND ANDREW J. RADER

EMOTIONAL HARM

Carter v. G.M., 361 Mich. 577 (1960)

In this workers' compensation case, the Michigan Supreme Court upheld a ruling by the workers' compensation board that James Carter, a machine operator who worked on assembly line production at General Motors, was entitled to disability compensation because of psychosis caused by stress at his job. Significantly, Mr. Carter was under only the ordinary pressures of a machine worker, but suffered from an underlying personality disorder and a predisposition to the development of schizophrenia that made him more vulnerable to those pressures. Thus, in the words of the compensation board that had granted compensation, the work pressures were the "straws that broke the camel's back."

Carter's significance lies not only in the fact that the Michigan Supreme Court did not require Mr. Carter to prove that he was subject to pressures more extraordinary than those endured by his coworkers, but also in the court's acceptance of the premise that a compensable disability need not be caused by a single *physical* injury or a single *mental* shock to plaintiff. Instead, the disability can be caused by psychiatrically succumbing to the usual ongoing daily pressures encountered by him and other employees engaged in similar work. Competent medical evidence having established the causal link between the ordinary work pressure and the disability, Mr. Carter was found to be entitled to compensation.

In so holding, the Supreme Court focused on the *purpose* of the workers' compensation rule, to wit, to ameliorate the economic plight of an employee injured in the course of and on account of his employment by imposing on industry the obligation to pay him weekly payments at rates based on his wages during the period of disability. This is as opposed to focusing on the *cause* of the injury, to wit, the determination that the disability resulted from a sudden disabling event or, for that matter, was caused by the predisposition to the disability. So long as the precipitant to the injury was work related, the court ruled, the injury is subject to compensation under the workers' compensation framework.

Dillon v. Legg, 69 Cal. Rptr. 72, 441 P.2d 912 (1968)

At common law, a person could not bring suit for psychic injuries (e.g., posttraumatic stress) if he or she was not in personal danger from the acts he/she witnessed. *Dillon v. Legg* represents a break with judicial tradition by recognizing a cause of action based exclusively on the psychic injury of a claimant *not personally endangered* by the acts of the tortfeasor.

On September 27, 1964, infant Erin Lee Dillon, while crossing the street with her mother and sister, was hit and killed by an automobile operated by the defendant. Plaintiffs commenced suit, alleging a cause of action for the sister's fear and distress for her own safety (she was nearly hit by the automobile), and another cause of action demanding compensation for the mother who, while not personally endangered by the accident, suffered horror and fright as a result of witnessing the collision with Erin. Upon motion by the defendant, the trial court sustained the sister's cause of action because she was personally endangered by the defendant's automobile, but dismissed the mother's cause of action, holding that California law does not recognize a cause of action for people outside the "zone of danger."

The trial court relied on California precedent holding that claims for purely psychic injury by individuals not personally in danger were not legally cognizable because the tortfeasor owed a duty only to the individual in fear for *his own* safety—not for the safety of others. A person outside this "zone of danger" could not recover in court, and any pleadings made alleging fear, shock, or distress caused by witnessing harm to others were dismissed by the court for failing to state a cause of action. Consequently, the sister's cause of action was valid because she had been in the zone of danger, but the mother's cause of action failed.

The reasoning behind the refusal to recognize liability to those people not in fear for their own safety was that

the imposition of duty would invite fraudulent claims and involve the court in the "hopeless task" of defining the extent of the tortfeasor's liability. In the court's words, "in substance, the definition of liability being impossible, denial of liability is the only realistic alternative."

On appeal, the California Supreme Court broke new ground, acknowledging and endorsing the commonsense notion of "natural justice" that "all ordinary human feelings are in favor of [the mother's] action against the negligent defendant." Eviscerating the "zone of danger" distinction, the court concluded that it could "hardly justify relief to the sister for trauma which she suffered upon apprehension of the child's death and yet deny it to the mother merely because of a happenstance that the sister was some few yards closer to the accident. The instant case exposes the hopeless artificiality of the zone of danger rule." Any fear of fraudulent claims, the court continued, does not warrant courts of law in closing the door to all such cases. Courts must depend on the efficacy of the judicial processes to ferret out the meritorious from the fraudulent in particular cases.

AMERICANS WITH DISABILITIES ACT

Bragdon v. Abbott, 118 S.Ct. 2198 (1998)

What physical and mental conditions does the Americans with Disabilities Act ("ADA") protect, and how is the analysis made as to whether a person suffers from such a condition? Does it protect people who carry a disease yet suffer no symptoms? *Bragdon* represents the Supreme Court's pronouncement that a person infected with the human immunodeficiency virus (HIV), even if asymptomatic, suffers from a "disability" under the ADA. The ADA seeks to eliminate discrimination against the disabled. Upon remand to the First Circuit Court of Appeals, it was held that HIV-positive status, in and of itself, had not been scientifically shown to "pose a direct threat to the health or safety of others," and therefore a dentist's refusal to fill the cavity of an asymptomatic HIV-positive patient in his office violated the ADA.

Respondent Sidney Abbott was infected with HIV when she presented for a dental appointment with the petitioner, Dr. Randon Bragdon. Although she was asymptomatic, she disclosed her HIV status to Dr. Bragdon, who performed a dental examination. During the examination, he found a cavity, which, because of Ms. Abbott's HIV status, he refused to fill outside a hospital. He offered to perform the work at a hospital at no additional cost for his services, but Ms. Abbott would be responsible for the cost of using hospital facilities. Ms. Abbott declined treatment and sued Dr. Abbott for violating her rights under the ADA.

The ADA states that "No individual shall be discriminated against on the basis of disability in the full and equal enjoyment of the goods, services, facilities, privileges, advantages, or accommodations of any place of public accommodation by any person who…operates a place of public accommodation."

The court first found that an HIV infection constitutes a "disability" under the ADA. The relevant section of the ADA defines disability as "a physical or mental impairment that substantially limits one or more of major life activities of such individual." The analysis of whether Ms. Abbott fit within that definition has three components: (1) whether her HIV infection was a physical impairment; (2) whether the activity on which she relied (reproduction and child bearing) constituted a major life activity; and (3) whether the physical impairment substantially limited the major life activity.

Addressing the first element, that the HIV was a physical impairment, the court found that because the virus immediately begins to damage the infected person's white blood cells and because of the severity of the disease, it is an impairment *from the moment of infection*. Moreover, because the disease is "invariably fatal," the court ruled that it is axiomatic that it impacts upon major life activities, including the one presented in this case, reproduction. Focusing on the third element, the court stated that Ms. Abbott's infection substantially limited her ability to reproduce in two ways: first, an infected woman who tries to conceive imposes a significant harm of infection on her male partner; second, the infected woman risks infecting her child during gestation and childbirth.

Having concluded that HIV infection is a disability under the ADA, the court next discussed whether Dr. Bragdon was permitted to refuse Ms. Abbott treatment in his office under the exception to the ADA in cases where the infectious condition poses a "significant risk to the health or safety of others that cannot be eliminated by modification of policies, practices, or procedures or by the provision of auxiliary aids or services." Here, the Supreme Court remanded the matter back to the U.S. Court of Appeals, which, after studying the state of scientific knowledge on the transmission of HIV, and being guided by the collective wisdom of professionals in the field of dentistry, determined that no proof of infection to health-care workers in the dental office existed and, further, that universally accepted methods of preventing infection were practicable and effective. Consequently, it was determined that the risk of infection could be eliminated.

Thus, the Supreme Court, in conjunction with the holding by the Court of Appeals after remand, held that HIV infection is, in and of itself, and even in the absence of symptoms, a disability within the meaning of the ADA and entitled to the protections the ADA affords.

Pennsylvania Department of Corrections v. Yeskey, 118 S.Ct. 1952 (1998)

Another question concerning the Americans with Disabilities Act is "to whom does it apply?" In *Yeskey*, the Supreme Court was asked whether it applies to prison inmates. The court answered that it does.

Ronald Yeskey was sentenced to 18–36 months in a Pennsylvania correctional facility but was recommended for placement in a Motivational Boot Camp for first-time

offenders, the successful completion of which made him eligible for parole in just 6 months. However, he was refused admission to the program because he suffered from hypertension, and brought suit alleging that the exclusion from the program derogated his rights under the ADA. The State of Pennsylvania, on the other hand, argued that the ADA was not intended to apply to prison inmates.

In a concise opinion, the court looked to the clear wording of the statute, that proscribes any "public entity" from discriminating against any "qualified individual with a disability" on account of that disability. In this case, Mr. Yeskey was a qualified individual, as he was entitled to enter into the boot camp, and the Pennsylvania Department of Corrections is a public entity. The unambiguous language makes no exception for prison inmates, and the High Court will not imply one. Prison inmates are entitled to protection under the Americans with Disabilities Act.

Olmstead v. L.C. ex. rel. Zimring, 119 S.Ct. 2176 (1999)

In another decision lending broad interpretation of the ADA, the Supreme Court ruled that "discrimination" includes confining mentally ill patients in unnecessarily restrictive facilities. The ADA requires states to place persons with mental disabilities in community settings rather than in institutions when the state's treatment professionals have determined that community placement is appropriate, the transfer from institutional care to a less restrictive setting is not opposed by the individual, and the placement can be reasonably accommodated, taking into account the resources available to the state and the needs of others with mental disabilities.

L.C. and E.W. were mentally retarded women. L.C. had also been diagnosed with schizophrenia and E.W. with a personality disorder. They were confined to the Georgia Regional Hospital psychiatric unit, but in time became sufficiently stabilized to be treated in a community-based setting. Each woman wanted to leave the ward, and each woman's treating physicians agreed that they could be appropriately treated outside the hospital walls, with the goal of reintegrating them into mainstream society. Nonetheless, each woman remained confined because the state lacked sufficient resources to place them in a less restrictive environment.

The Americans with Disabilities Act states in pertinent part that

> No…individual with a disability shall, by reason of such disability, be excluded from participation in or be denied the benefits of the services, programs, or activities of a public entity, or be subjected to discrimination by such entity.

Congress instructed the Attorney General to promulgate regulations administering the ADA, which was done. One of the regulations requires public entities to "make reasonable modifications" to avoid discrimination on the basis of disability, unless those modifications would fundamentally alter the nature of the service, program, or activity.

The State of Georgia averred that the women were not being discriminated against by reason of their disability, but rather were being confined due to inadequate funding. The state sought to place this case into the exception to the ADA's nondiscrimination rules by claiming that, because it has the obligation to administer care to a wide variety of people with mental disabilities, the requirement that patients be placed in the least restrictive setting would unreasonably and fundamentally alter the services the state provides.

The first question the court answered was whether the continued confinement in a psychiatric unit, when the patient and the treatment team feel that a community-based program is appropriate, is a form of discrimination. Answering in the affirmative, and finding support in the positions of the Attorney General and various amici briefs (including one submitted by the American Psychiatric Association), the court held that unjustified institutional isolation discriminates in two ways: first, institutional placement of persons who can handle and benefit from community settings perpetuates unwarranted assumptions that persons so isolated are incapable or unworthy of participating in community life (i.e., stigma), and second, confinement in an institution severely diminishes the everyday life activities of individuals, including family relations, social contacts, work options, economic independence, educational advancement, and cultural enrichment.

Having thus concluded that unjustified isolation is a form of discrimination, the court turned to the state's concern that the provision of outside placement to some patients may impose financial strains that could affect the treatment afforded other patients. Here, the court returned to the language of the regulations: the state must make "reasonable modifications" to avoid discrimination, and need not make changes that fundamentally alter the state's programs. This, the court held, requires states to balance the equities of all patients in meting out the requirements of the state's mental health system as a whole. To that end, the states require wide latitude to fashion their own systems that minimize discrimination yet do so in a financially responsible manner.

United States v. Georgia, 546 U.S. 151 (2006)

Can a prison inmate sue the state for money damages under the civil claims portion of the ADA when the state has sovereign immunity protecting it from such suits? Or does the state's sovereign immunity override an individual's right to bring such claims? The answer, under *United States v. Georgia*, is that an individual has a right, under the Fourteenth Amendment, to bring such claims, notwithstanding the state's claim of immunity.

Tony Goodman, a paraplegic inmate confined to a Georgia prison, sued the State of Georgia under Title II of the Americans with Disabilities Act of 1990. The ADA provides that

> no qualified individual with a disability shall, by reason of such disability, be excluded from participation in or be denied the benefits of the services, programs, or activities of a public entity, or be subjected to discrimination by any such group.

In addition, the ADA authorizes suits by private citizens for money damages against public entities that violate this provision.

Mr. Goodman claimed that the prison conditions in which he was forced to live violated his rights under Title II of the ADA. In particular, he claimed that he was confined 23–24 hours a day in a 12- by 3-foot cell in which he could not turn his wheelchair around, that the toilet and shower facilities were not accessible by him, and that as a result, he was at times forced to sit in his own waste. He also claimed that this treatment violated his Eighth Amendment right to be free from cruel and unusual punishment, as applied to the states through the Fourteenth Amendment.

The case was dismissed at the trial level because, in part, Georgia law barred claims for money damages against the state under sovereign immunity statutes. The Eleventh Circuit affirmed.

The Supreme Court reversed. Writing for the Court, Justice Antonin Scalia found that Congress had clearly and unequivocally intended the money remedies contained in the ADA to be available against all states and that Congress has the authority to enforce the provisions of the Fourteenth Amendment by providing for money damages when states violate the amendment. But Justice Scalia left unanswered the question of whether money damages are recoverable in those circumstances where the state's conduct *does* violate the ADA but *does not* rise to the level of a constitutional violation.

Thus, despite Georgia's assertion of sovereign immunity, Mr. Goodman could recover money damages for violations of the ADA that also violate the Fourteenth Amendment.

SEXUAL HARASSMENT

Meritor Savings Bank v. Vinson, 477 U.S. 57 (1986)

Meritor supplies the Supreme Court's exposition of the meaning of "sexual discrimination" or "sexual harassment" under Title VII of the Civil Rights Act of 1964. The court emphasized that there are two distinct forms of such discrimination: quid pro quo sexual harassment, in which sexual favors are demanded in exchange for workplace retention or promotion, and hostile environment sexual harassment, in which the recipient is subjected to unwelcome sexual comments or advances. *Meritor* also holds that, within limits, a supervisory employee who harasses a subordinate employee does so as the agent of the employer, thereby subjecting the employer to liability for such harassment.

Title VII of the Civil Rights Act of 1964 makes it "an unlawful employment practice for an employer…to discriminate against any individual with respect to his compensation, terms, conditions, or privileges of employment, because of such individual's race, color, religion, sex, or national origin."

In 1974, respondent Michelle Vinson met Sidney Taylor, a vice president of Meritor Bank. Ms. Vinson worked her way up the bank ladder from teller-trainee, to teller, to head teller to assistant branch manager. It was undisputed that her advancement was due to merit alone. In September 1978, Ms. Vinson took an indefinite sick leave from the bank and was fired a month later for excessive use of her sick leave.

Following her discharge, she filed suit against Meritor Savings Bank, claiming that it was liable for sexual harassment perpetrated by Mr. Taylor, its employee. She averred that Mr. Taylor asked her out to dinner and suggested that they go to a motel. While at first she resisted his advancements, she ultimately acquiesced out of fear of losing her job. During the next 4 years, Ms. Vinson had sexual relations with Mr. Taylor approximately 40–50 times, and was subjected to demeaning sexual fondling and comments in front of other employees.

After a trial, the District Court held that because Ms. Vinson's relationship was a voluntary one having nothing to do with her continued employment or her advancement or promotions, she was not the victim of sexual discrimination while employed at the bank. Moreover, the District Court held that because the bank had an express policy against discrimination, and no one had ever lodged a complaint about sexual harassment by Taylor, the bank was not on notice and could not be held liable.

The U.S. Court of Appeals for the District of Columbia Circuit reversed. It found that there are two types of harassment: that which involves the conditioning of concrete employment benefits on sexual favors, and harassment that, while not affecting economic benefits, creates a hostile or offensive working environment. The court also found that the bank could be liable through an agency theory: a "supervisor" is an agent even if he or she lacks authority to hire, fire, or promote, because "the mere existence—or even the appearance—of a significant degree of influence in vital job decisions gives any supervisor the opportunity to impose on employees."

The U.S. Supreme Court heard the case and affirmed the rulings of the Court of Appeals. In the high court, the bank claimed that in enacting Title VII, Congress intended to prohibit discrimination with respect to economic, not purely psychological, damages. The court, through the pen of Justice Rehnquist, strongly disagreed, pointing out that not only did the plain language of the statute not so limit the damages, but the intent of Congress was "to strike at the

entire spectrum of disparate treatment of men and women" in employment.

In support of its position, the court looked to the position taken by the Equal Employment Opportunity Commission (EEOC). That agency determined that the "hostile environment" (i.e., non quid pro quo) harassment violates Title VII, which affords employees the right to work in an environment free from discriminatory intimidation, ridicule, and insult. Recalling a precedent, the court stated:

> Sexual harassment which creates a hostile or offensive environment for members of one sex is every bit the arbitrary barrier to sexual equality at the workplace that racial harassment is to racial equality. Surely, a requirement that a man or woman run a gauntlet of sexual abuse in return for the privilege of being allowed to work and make a living can be as demeaning and disconcerting as the harshest of racial epithets.

This is not to imply that all workplace conduct of a sexual nature violates Title VII. The test is whether it is sufficiently severe or pervasive to alter the conditions of the victim's employment and create an abusive environment. Nor does the fact that the plaintiff had "voluntary" intercourse with Mr. Taylor conclusively prove there was no harassment. The test, according to the court, was not whether her participation was "voluntary," but rather whether Mr. Taylor's advances were unwelcome.

The court was more circumspect with respect to whether the failure of the bank to be on notice of the harassment, or the fact that it had a grievance procedure in place, absolved it of liability. While not placing strict liability on an employer for the harassment of its employees, the court did look to traditional agency theory to find that employers can be held liable, though not automatically, for the sexually harassing acts of their supervisors.

Harris v. Forklift Systems, Inc., 114 S.Ct. 367 (1993)

After the court's decision in *Meritor Savings Bank*, a dispute arose among the appellate courts as to what conduct created "abusive work environment" harassment. Was it necessary (as the district court in this case found) that the environment must "seriously affect [an employee's] psychological wellbeing" or lead the plaintiff to suffer injury? No, according to the Supreme Court's ruling in *Harris*.

Teresa Harris was a manager at Forklift Systems, Inc. Charles Hardy was Forklift's president. Throughout Ms. Harris' employment, Mr. Hardy frequently directed offensive remarks at Ms. Harris, often in the presence of other employees. These comments were not only of the sexual variety (e.g., he suggested that they "go to the Holiday Inn to negotiate [Harris'] raise"), but also discriminatory gender statements (e.g., she was a "dumb ass woman"). Harris complained, and Hardy apologized and explained that he was only kidding, but soon thereafter he returned to making frequent insulting utterances. Harris sued under Title VII.

The District Court found that some of Hardy's comments "offended [Harris], and would offend the reasonable woman," but it also found that the comments were not so severe as to be expected to seriously affect Harris' psychological well-being. The court did not believe that she suffered injury, because the working environment was not "so poisoned as to be intimidating or abusive." Therefore, the District Court ruled against Harris. The U.S. Court of Appeals for the Sixth Circuit affirmed.

Justice O'Connor, writing for the Supreme Court, reaffirmed the holding of *Meritor* that Title VII does not require "economic" or "tangible" discrimination; rather, it only requires that the discriminatory conduct be "sufficiently severe or pervasive to alter the conditions of the victim's *employment* and create an abusive working environment." This is an objective standard (i.e., the proverbial "reasonable person" would find the environment hostile). However, the Court added, even an environment that does not seriously affect employees' psychological well-being can detract from employees' job performance, discourage employees from remaining on the job, or keep them from advancing in their careers. In addition, even without these tangible effects, the discrimination offends Title VII's broad rule of workplace equality.

Because sexual harassment can affect the work environment even without harming the well-being of employees, the court found that an objectively abusive environment alone is sufficient to state a claim for violation of Title VII.

Oncale v. Sundowner Offshore Services, Inc., 118 S.Ct. 998 (1998)

In *Oncale*, the Supreme Court reaffirmed that an objectively sexually abusive environment always violates Title VII's proscription against discrimination based on sex. Whereas in *Meritor Savings Bank* the court laid out the general elements of a sexually harassing environment, and in *Harris* the court ruled that the victim's psychological well-being need not be harmed, in *Oncale* the court ruled that same-sex sexual harassment is equally actionable because it is still discrimination "because of…sex."

Joseph Oncale was a roustabout on an eight-man crew on an oil platform in the Gulf of Mexico. On several occasions, he was forcibly subjected to sexual abuse by co-workers in the presence of other crewmen. He had been threatened with rape and finally left the job because he felt that if he stayed, he would be raped. He filed suit, but the U.S. District Court of the Eastern District of Louisiana dismissed the case, holding that there was no cause of action for same-sex sexual harassment. The Court of Appeals affirmed.

The Supreme Court reversed. While it conceded same-sex sexual harassment was "assuredly not the principal evil Congress was concerned with when it enacted Title VII," at bottom Congress wanted to prohibit discrimination based on sex. Furthermore, not only does the statute protect

men as well as women, but it also protects people from discrimination from people of the same protected class. For example, the court had in the past rejected any conclusive presumption that an employer will not discriminate against members of his own race. Quoting precedent, the court observed that "because of the many facets of human motivation, it would be unwise to presume as a matter of law that human beings from one definable group will not discriminate against other members of that group."

Taking the point one step further, Justice Scalia, writing for the court, noted that to be unlawful the discrimination need not be motivated by sexual desire. Thus, a woman who simply does not like other women to be present in her workplace, and creates an abusive environment to keep other women out, would be liable under the statute for sex discrimination. "The critical issue, Title VII's text indicates, is whether members of one sex are exposed to disadvantageous terms or conditions of employment to which members of the other sex are not exposed."

Justice Scalia rejected the argument that this expansive interpretation of Title VII transforms the statute into a general civility code. *Meritor* and *Harris* stood for the proposition that to be actionable the discrimination must be severe and pervasive enough to create an objectively hostile environment. The statute does not reach into innocuous differences between the sexes, just as it does not forbid male-on-male roughhousing or even intersexual flirtation. It requires neither asexuality nor androgyny in the workplace. Rather, it bans an objective level of abuse as a condition of employment.

JUVENILE JUSTICE

In re Gault, 387 U.S. 1, 87 S.Ct. 1428 (1967)

In re Gault represented a broad elucidation and expansion of the procedural due process rights enjoyed by juveniles under the U.S. Constitution. Gerald Gault, a 15-year-old Arizona boy, was taken into custody on June 8, 1964, for making obscene phone calls. His parents were not at home and were not notified of the detention, and only learned from people in the neighborhood that Gerald was in custody.

The arresting officer filed a petition with the court that resulted in a hearing being scheduled for the next day, June 9. The petition made no reference to the factual basis for the apprehension or the judicial action contemplated. Rather, it stated only that "said minor is under the age of eighteen years, and is in need of the protection of this Honorable Court; [and that] said minor is a delinquent minor." The petition requested a hearing and an order regarding the care and custody of Mr. Gault.

On June 9, Gerald, his mother, his older brother, and probation officers appeared before the Juvenile Judge in chambers. The complainant was absent, there was no sworn testimony, and no record or memorandum of the substance of the hearing was made. The arresting officer testified as to what the complainant had told him and to a confession made by Gerald, which had been obtained without parents or counsel being present and without any notification to Gerald or a parent of his rights. On June 15, another hearing was held, wherein a "referral report" was made by the probation officers and filed with the court, but was not disclosed to Gerald or his parents. Again, the complainant was not present nor was any record made. At the close of the hearing, Gerald was committed as a juvenile delinquent to the State Industrial School for 6 years.

No appeal of juvenile cases was permitted by Arizona law, so a federal writ of habeas corpus was filed. This writ was dismissed by the lower court. On appeal to the Arizona Supreme Court, the petitioners argued that the Arizona Juvenile Code violated Gerald's due process rights by not requiring that parents and children be apprised of the specific charges, by not requiring proper notice of a hearing, by not providing for an appeal, by allowing the use by the juvenile court of unsworn hearsay testimony, and by the failure to make a record of the proceedings. In addition to these due process arguments, the appellants also asserted the Arizona Juvenile Code abrogated the Gaults' right to confront witnesses against them and that the failure to *advise* appellants of their right to counsel and their privilege against self-incrimination violated those protections provided by the Constitution. It was also contended that the removal of Gerald from the custody of his parents without a finding of their unsuitability was improper.

The Arizona Supreme Court, while conceding that the constitutional guarantee of due process is applicable to such proceedings, held that such guarantees are "implied" in the Arizona Juvenile Code, and affirmed the dismissal of the writ.

The U.S. Supreme Court granted leave to appeal and in a far-reaching decision sought to eliminate the perceived distinction between adult "adversarial" criminal proceedings wherein the state stands as prosecutor, and juvenile proceedings, wherein the state is theoretically acting *in loco parentis*, i.e., acting in the child's best interest. By exposing the juvenile system as essentially a criminal system for the young, and upon reviewing the procedural sequence of events, the Supreme Court ruled that the constitutional protections affording due process to adults are, in large part, applicable to juvenile delinquency proceedings because the juvenile proceedings, just like felony proceedings against adults, involve a determination that may subject the juvenile to a loss of liberty for years. Thus, juveniles were held to be constitutionally entitled to timely notice of hearings, to be advised of their right to counsel, to actually have counsel, and to cross-examine witnesses against them. Moreover, the privilege against self-incrimination, which guarantees that no person shall be compelled to be a witness against himself when he is threatened with a deprivation of liberty, applies to juvenile delinquency proceedings.

In *In re Gault*, the U.S. Supreme Court decreed that juvenile delinquency proceedings are analogous to adversarial criminal proceedings, and imbued minors subject to delinquency proceedings with broad constitutional protection.

Fare v. Michael C., 442 U.S. 707 (1979)

Generally, under the Fifth Amendment, all interrogation of a person in the custody of the police must stop if the person indicates in any manner that he or she wishes to speak with an attorney or invokes his or her right to remain silent. But what of a young murder suspect who asks to speak with his probation officer whom he trusts as an advisor?

Michael C. was taken into custody of the Van Nuys, California, police on suspicion of murder. After being advised of his *Mirada* rights to remain silent and to have an attorney present during questioning, Michael asked to speak with his trusted probation officer. The request was refused, and Michael went on to make highly incriminating statements and sketches. Upon being charged with murder in Juvenile Court, he moved to suppress the statements and sketches based on violations of his right to remain silent and to have an attorney present during questioning.

The Juvenile Court detailed Michael's extensive past experience with the legal system and found that Michael had voluntarily waived his rights. Accordingly, the motion to suppress was denied. But the California Supreme Court reversed, holding that Michael's request for his probation officer, a guardian figure whom Michael had been instructed to call in case of encounters with the police, constituted a *per se* invocation of his rights. It was, thought the California Supreme Court, like asking to call one's parent.

The U.S. Supreme Court granted *certiorari* because California's invocation of the *per se* standard meant that rather than analyzing the issue under a "totality-of-the-circumstances" surrounding the waiver of the *Miranda* rights to determine whether the waiver was voluntary, the California court had held that, *as a matter of federal law,* a juvenile's request for his probation officer carried the same significance as a request for an attorney. This threatened a significant expansion of the *Miranda* doctrine and rights.

The U.S. Supreme Court reversed the California Supreme Court because requesting an attorney and requesting a probation officer are not alike. Instead, according to the court, only an attorney holds a "critical position" in the legal system because of his or her unique ability to guard the minor's Fifth Amendment privileges and to prevent overreaching by police officers. And, the *per se* rule applies only to attorneys because "the lawyer is the one person to whom society as a whole looks as the protector of the legal rights of that person in his dealings with the police and the courts." This differs from a probation officer, who is not so trained in the law as to be a legal advisor. To the contrary, the probation officer is allied with the prosecution and it is he or she who files the criminal petition against the accused. Whereas an attorney, in his or her best professional judgment, may tell an accused to remain silent to thwart an investigation, a probation officer is duty-bound to assist the police in their investigation.

Justice Scalia said that juvenile courts are perfectly capable of reviewing the "totality-of-the-circumstances" to determine whether a particular person has made a voluntary waiver. Given the enormous variety of claims of involuntary waiver of *Miranda* rights that confront the lower courts on a regular basis, and the lower courts' ability to take into consideration the juvenile's age, experience, education, background, intelligence, and capacity to understand the warnings given to him or her, the high court found that only the flexibility available in the totality-of-the-circumstances standard would suffice. Indeed, postulated Justice Scalia, the totality-of-the-circumstances may even result in a finding that a particular juvenile in calling for his or her parents or a probation officer was invoking his or her right to remain silent, whereas an older, more experienced juvenile, similarly calling for his or her parent or probation officer, was not invoking this right.

The Supreme Court held that the California Supreme Court wrongly applied a *per se* standard and went on to rule that, under the totality of the circumstances, Michael had not invoked his right to silence or his privilege against self-incrimination. Considering his extensive experience with the criminal justice system and the lack of proof of coercion or improper police tactics, there was no reason to believe that he did not understand his rights before making his statements. Therefore, he voluntarily and knowingly waived his rights and consented to interrogation, and his statements and sketches could be used against him in the murder prosecution.

Graham v. Florida, 130 U.S. 2011 (2010)

In *Graham v. Florida*, the U.S. Supreme Court held that the sentence of life imprisonment without the possibility of release on a juvenile offender in a *nonhomicide* case violates the defendant's Eighth Amendment right to be free of cruel and unusual punishment. All juveniles convicted of such crimes must be given the opportunity for (but not promise of) release.

At age 16, Petitioner Graham committed an armed robbery. He and some friends broke into a restaurant. One of Graham's accomplices struck the restaurant manager on the head with a metal bar causing a laceration that required stitches. Graham was caught and, under Florida law, was prosecuted as an adult for armed burglary with assault or battery, a first-degree felony carrying a maximum penalty of life imprisonment without the possibility of parole. Under a plea agreement, he was sentenced to probation. Soon after his plea, Graham was involved in two home invasion robberies, during one of which his accomplice was shot. Graham dropped his wounded accomplice off at the hospital but was apprehended after doing so. Three guns were found in his car.

Following a hearing, the judge, despite having the authority to sentence Graham to the 30 years requested by the prosecutor or the 4 years recommended by the Florida Department of Corrections, sentenced him to life in prison without the possibility of parole for violating his probation. Thus, the sentence punished the crime he committed at age 16.

Writing for the court, Justice Kennedy explained that the court addresses cruel and unusual punishment cases

under two types of analysis. In the first, the court considers all the circumstances of the case to determine whether the sentence is unconstitutionally excessive. Under this analysis, the court begins by determining whether a sentence for a term of years is grossly disproportionate to the defendant's crime. Next, the court may review whether the sentence is out of proportion to sentences meted out by other jurisdictions for the same crime. If either is disproportionate, under the first analysis the sentence may be considered cruel and unusual.

The second classification of cases uses categorical rules to define the Eighth Amendment standards. Within this second classification are two subsets, one considering the nature of the offense, the other considering the characteristics of the offender.

In applying the second, categorical approach, the court first looks at nationwide standards to determine whether any consensus has arisen surrounding a particular issue. In reviewing national standards on the issue at bar, the court found that 37 states as well as the District of Columbia and the federal system permit life without parole for juvenile nonhomicide offenders. This, however, does not complete the analysis. The court must also look at the *de facto* sentences meted out. Reviewing these, the court found that while 37 states permit such sentencing, only 11 states have actually imposed it. And of the 123 juvenile serving such sentences in the entire United States, 77 were in Florida, and the rest scattered throughout the remaining 10 states. Moreover, the court observed that the mere fact that the sentence is *available* under a given state's statutes does not mean that the legislature in that state *desired* that it be imposed on juveniles being charged as adults. Based on this review of *actual* sentences imposed, Justice Kennedy determined that the imposition of life without the possibility of parole for nonhomicidal juveniles is quite rare and that there exists a consensus *against* the imposition of such sentence on juveniles.

Further exploring the issue, Justice Kennedy wrote that a given sentence must also meet penological goals. Compared to adults, juveniles are less mature, have an underdeveloped sense of responsibility, and are more vulnerable to negative influences. Therefore, they are less culpable than adults, and must receive a correspondingly lesser sentence. Simultaneously, a juvenile has greater capacity to change as he or she matures and this, too, distinguishes him or her from a mature adult.

It is also wrong to equate nonhomicidal crimes with homicides. While a nonhomicidal crime may be quite devastating to the victim, a life has not been taken and therefore the nonhomicidal crime is less depraved than the homicide. According to the court, a sentence of life without the possibility of parole, while not the same as a death sentence, carries some of the same punishments. It deprives the defendant of any hope, destroys the desire or purpose of self-improvement, and informs the convict that whatever the future may hold for his or her mind and spirit, he or she will nonetheless spend the rest of his or her days in prison. For a 16-year-old boy convicted of a nonhomicidal crime, the imposition of life in prison without the possibility of parole serves no penological goals.

For the same reasons that a juvenile is not as culpable as an adult for his or her wrongdoing (lack of maturity, etc.), the goals of reduced risk of recidivism, deterrence, and retribution for the crime are more poorly achieved when applied to a juvenile. Juveniles do not have the same mental or emotional maturity or responsibility as do adults. On the other hand, the possibility of rehabilitation, another penological goal, is greater in a juvenile, who may still grow and develop into a more responsible adult.

The State of Florida brought forth several other arguments, among them that judges should have the discretion to impose life without parole on juveniles for particularly heinous crimes. Justice Kennedy acknowledged the necessity for flexibility of sentencing, but observed that even a case-by-case approach is constricted by the Eighth Amendment.

The Supreme Court in *Graham* made the categorical ruling that juveniles deserve the opportunity to rehabilitate themselves and, while they are not *entitled* to release from prison, they are required to have the *chance* of release. Consequently, the imposition of a life sentence without the possibility of parole on a juvenile for a nonhomicide crime violates the Eighth Amendment.

Miller v. Alabama, 132 S.Ct. 2455 (2012)

In *Graham,* the Supreme Court took up the constitutionality of a sentence of life imprisonment without possibility of parole for juveniles who committed a *nonhomicide* offense. In *Miller v. Alabama,* the court addressed whether a mandatory life imprisonment without possibility of parole for convicts who were under the age of 18 at the time they committed a *homicide* violates the Eighth Amendment's prohibition on cruel and unusual punishment and determined, for many of the same reasons announced in *Graham*, that it does.

Miller involved two separate cases in which a 14-year-old boy was convicted of murder and sentenced under the state sentencing requirements to mandatory life imprisonment without possibility of parole. In one case, Kuntrell Jackson accompanied friends in an armed robbery during which one of Mr. Jackson's co-defendants killed a store clerk. Jackson was convicted of capital felony murder. In the other case, Evan Miller, after a robbery gone wrong, beat the victim to death with a baseball bat.

Reaching back to two lines of precedent, Justice Kagan, writing for the court, said that we first start with the idea from *Roper v. Simmons* (holding unconstitutional the imposition of the death penalty on juveniles) and *Graham v. Florida* (holding unconstitutional the imposition of mandatory life without possibility of parole for juveniles who commit a nonhomicide offense) that children are constitutionally different from adults for purposes of sentencing because they have diminished culpability and greater

prospects of reform, and joining it with other cases requiring that the sentencing judge be permitted to consider the characteristics of a defendant before sentencing him or her to death.

Reviewing these lines of cases, the court recognized that the same factors that diminish a juvenile's culpability in nonhomicide cases and therefore may render a minimum harsh sentence disproportionate to the crime (e.g., immaturity, recklessness, lack of comprehension of consequences) are also present in homicide cases. Youth, itself, is a mitigating factor a sentencing court must consider. Moreover, because a youth sentenced to life without the possibility of parole will spend more years and a greater percentage of his or her life in prison than a similarly sentenced adult, the court considered life imprisonment without the possibility of parole to be, for the juvenile offender, on par with the death sentence for an adult and must be viewed accordingly.

Thus, the reasoning in *Graham* applies to any juvenile life without parole sentence, and the court ruled that the Eighth Amendment forbids a sentencing scheme that mandates life in prison without possibility of parole for juvenile offenders.

HOWARD OWENS AND JEREMY COLLEY

COMPETENCE IN CRIMINAL CASES

Dusky v. United States, 362 U.S. 402 (1960)

The *Dusky* case provided the opportunity for the Supreme Court to define the test for competence to stand trial in a criminal case. The defendant, Milton Dusky, had been convicted in U.S. District Court in Missouri of kidnapping and interstate transport of a minor. Dusky asserted on appeal that the trial court erred in three ways: first, in finding him competent to stand trial; second, in submitting the question of insanity to the jury for decision; and third, in instructing the jury according to the *M'Naghten* test for insanity. The U.S. Court of Appeals upheld the lower court on all three issues.

Dusky was originally charged, along with two juvenile co-defendants, with abducting a 15-year-old girl and driving her across state lines, where the two boys raped her and Dusky attempted to rape her. His attorney raised the issues both of his competence and insanity, and he was hospitalized for examination at a federal medical center for 4 months. A psychiatric report gave a diagnosis of "Schizophrenic Reaction, chronic undifferentiated type," marked by visual hallucinations and complicated by alcoholism. A later report stated that the defendant was "unable to properly understand the proceedings" and "unable to adequately assist counsel." In support of this opinion, the report noted that Dusky felt he was being "framed." One of the experts testified that while the defendant did understand the charges and the basic elements of court procedure, he was "unable properly to assist in his own defense 'due to an inability to interpret reality from unreality,' and to 'suspicions' and 'confused thinking.'" In spite of this testimony, the trial court ruled that the defendant had sufficient mental capacity to stand trial, citing the fact that he was oriented and, "based on the limited evidence" available, that he was able to assist counsel. Dusky was then convicted at trial.

The Court of Appeals declined to overrule the verdict, holding that "how much mental capacity or alertness a defendant must have to be able to assist his counsel" was "a question of fact for the trial court." The court noted its policy that a trial judge not be required to believe evidence he or she found unconvincing and pointed out that, as a result, the judge was not bound by the conclusions of expert witnesses. The court also upheld the conviction on the other two issues presented.

In a brief *per curiam* decision, the Supreme Court overturned Dusky's conviction. It held that the record was insufficient to support the conclusion that the defendant was competent to stand trial in the first place; therefore, the court did not have to address the insanity issues. The case was remanded to the district court for a new hearing on the issue of Dusky's competence and for a new trial, if he was found competent.

Although the court did not spell out its rationale for the decision in any detail, it endorsed the position taken by the solicitor general that "the test must be whether [the defendant] has sufficient present ability to consult with his lawyer with a reasonable degree of rational understanding—and whether he has a rational as well as factual understanding of the proceedings against him." The court clearly believed that the trial judge needed more information than he had available to decide the issue of competence, and that he had relied on inadequate criteria—the mere facts that Dusky was oriented and had "some recollection of events"—without attending to the question of the defendant's rational understanding of the facts.

Wilson v. U.S., 391 F. 2d 460 (1968)

Robert Wilson was charged with five counts of assault and robbery in Washington, DC. Because of a head injury suffered in a car chase following this crime spree, Wilson had a permanent, retrograde amnesia with no recollection of the events charged in his indictment. He was admitted to St. Elizabeth's Hospital, where evaluation revealed that he had a normal mental status except for the amnesia. Psychiatric reports to the court, however, concluded that he was not competent to stand trial because of his amnesia. Although he was able to understand the charges against him, the

defense argued that he could not assist his attorney by recalling any facts about events surrounding his arrest. The trial court found Wilson to be competent, pointing out that he had the capacity to understand the details of the case by relying on other sources of information; he could follow the proceedings in court and discuss the case with his attorney in a rational way. The court indicated that memory loss would bar prosecution of a criminal case only when the defendant's memory was in fact "crucial" to the presentation of a defense.

On appeal to the U.S. Court of Appeals, the issue was whether Wilson was denied due process and effective assistance of counsel when the government brought him to trial suffering as he did from amnesia. The court accepted the trial court's analysis of what was required for competence. It reiterated the *Dusky* standard (*Dusky v. U.S.*, 362 U.S. 402, 1960), stating that the defendant should be able to consult with his attorney "with a reasonable degree of rational understanding" and should have a "rational as well as factual understanding" of what went on in court. More specifically, the issue was whether the defendant had sufficient information available about the events for which he was indicted, without having to rely on his own memory, in order to present his defense fairly at trial. The court remanded the case for further post-trial consideration of this issue, i.e., whether Wilson's amnesia in fact deprived him of a fair trial.

In a concurring opinion, Judge Leventhal pointed out that it is a common occurrence for a person to be convicted of negligent homicide even though his memory is impaired by intoxication at the time of the crime. In dissent, Judge Fahy took a directly opposite point of view (and apparently conflated the concepts of memory and understanding), maintaining that to try a man suffering from amnesia was the same as trying someone "in absentia," because the defendant would have a "complete lack of factual understanding."

Sieling v. Eyman, 478 F. 2d 211 (1973)

Gilbert Sieling was charged by the state of Arizona with multiple counts of assault. He was examined by three psychiatrists, all of whom agreed that he was insane at the time of the crime according to the relevant *M'Naghten* test. Two of the doctors also found him to be competent to stand trial, while one doctor stated that he was incompetent. The trial court found the defendant to be competent. One month later he asked to change his plea to guilty. This plea was accepted, and Sieling was sentenced to a long prison term. Subsequently, Sieling appealed his conviction, contending that his plea should not have been accepted because he was mentally incompetent to make it. He argued that his competence to waive the right to stand trial was a separate issue from competence to stand trial and was therefore not given consideration when the trial court ruled on his competence.

The U.S. Court of Appeals for the Ninth Circuit accepted Sieling's argument and remanded the case to the state court to pursue a retrospective examination of Sieling's competence to waive his rights at the time that he pled guilty. The court cited *Westbrook v. Arizona*, 384 U.S. 150 (1966) in support of the distinction between competence to stand trial and competence to waive important rights. The court reasoned that when a defendant's competence has previously been raised as an issue, the trial court must make a further inquiry to determine specifically whether the defendant's waiver of rights is adequate. The defendant's capacity in this situation must be measured by a higher standard, i.e., a degree of competence that would enable him to make decisions of "very serious import." The court borrowed from *Schoeller v. Dunbar,* 423 F. 2d 1183 (1970), the language of "reasoned choice" to define such a higher standard. The court therefore remanded the case back to the state court so that it could resolve the issue as to Sieling's competence to plead guilty. The court suggested that because there were on record three psychiatric opinions about Sieling's state of mind only a month before his guilty plea, the trial court might well have sufficient basis to resolve the issue of his competence, even according to a higher standard.

Estelle v. Smith, 451 U.S. 454 (1980)

In response to the Supreme Court's constitutional restrictions on the death penalty, a number of states passed new death penalty statutes that delineated more precise criteria for when the death penalty could be applied. *Estelle v. Smith* dealt with the use of psychiatric testimony to predict future dangerousness as a criterion for a death sentence in Texas.

In 1973, Ernest Smith was indicted for the murder of a store clerk in a robbery. The trial court ordered a psychiatric examination to determine Smith's competency to stand trial. After a 90-minute jail interview, Dr. James P. Grigson reported that the defendant was competent. Subsequently, a jury convicted Smith. Texas law required a separate sentencing procedure before the same jury. One of the criteria that the jury had to consider was the question of whether the defendant was likely to commit further acts of violence in the future. The prosecutor sought to call Dr. Grigson to testify, and the judge denied a defense motion to prevent his testifying. Dr. Grigson had acknowledged at a hearing that he had not obtained permission from Smith's attorney to examine him. Dr. Grigson testified that Smith was a "very severe sociopath" who would continue his present behavior and that he was going to commit other similar criminal acts in the future. The jury heard this testimony and found that Smith satisfied the criteria for the death penalty.

Smith petitioned for a writ of habeas corpus in U.S. District Court, which vacated his sentence on the grounds that the trial court made a constitutional error in admitting the psychiatric testimony. The U.S. Court of Appeals affirmed, holding that "Texas may not use evidence based on a psychiatric examination of the defendant unless the defendant was warned, before the examination, that he had a right to remain silent, was allowed to terminate the examination when he wished, and was assisted by counsel in deciding whether to submit to the examination."

The issue before the Supreme Court was whether the state's use of the psychiatric testimony violated Smith's rights under the Fifth and Sixth Amendments. The court affirmed the Court of Appeals' conclusion.

Writing for the majority, Chief Justice Burger dismissed the state's arguments that the Fifth Amendment privilege against self-incrimination was not relevant to the penalty phase of a trial and that Dr. Grigson's observations were "nontestimonial." The opinion noted that the psychiatric diagnosis depended on Smith's statements about the crime. While the judge had ordered the examination for the "neutral" purpose of determining competence, the state had used the results for another objective adverse to the defendant without informing him that it could do so. Noting that the decision in *Miranda v. Arizona*, 384 U.S. 436, 467 (1966), applied to "custodial interrogation," the court also rejected the idea that a psychiatric interview in jail was clearly noncoercive. When Dr. Grigson testified for the prosecution, his role changed, and he became an agent of the state rather than the court. Therefore, the court reasoned, the state violated Smith's Fifth Amendment rights. The court concluded that the state cannot compel a defendant to respond to a psychiatrist where the defendant has not initiated a psychiatric examination or introduced psychiatric evidence and where the interview could be used against him.

The opinion pointed out that the Sixth Amendment applies to the states through the due process requirement of the Fourteenth Amendment. The court had held previously that the Sixth Amendment entitles a person to an attorney once an adversarial proceeding has begun. Because the psychiatric examination of Smith occurred at a critical point and because counsel was not notified that the interview would encompass the issue of future dangerousness—about which issues the defendant could not be expected to know his rights—the state was violating Smith's right to the advice of counsel. The opinion quoted the amicus brief of the American Psychiatric Association to the effect that clinical predictions of violence have a very low reliability, and that psychiatrists have no special qualifications for forecasting dangerousness.

In a concurring opinion, Justices Stewart and Powell indicated that because of the lack of notice to counsel, the use of Dr. Grigson's testimony was impermissible at any stage of the trial. For the same reason, Justice Rehnquist argued that the Fifth Amendment issue did not have to be addressed; he noted his disagreement with the idea that the psychiatric examination was coercive in the way intended by *Miranda*.

Colorado v. Connelly

In *Colorado v. Connelly*, the Supreme Court addressed the question of when the confession of a criminal defendant is voluntary: the case established a requirement that some coercive activity on the part of the police is necessary for a court to find that a confession was made involuntarily. The case thereby set a strict limit on when the defense could raise the issue of competence to confess or competence to waive procedural rights.

Francis Connelly had approached a Denver police officer and spontaneously reported that he had committed a murder. The officer immediately advised Connelly of his rights (under *Miranda v. Arizona*, 384 U.S. 436, 1966). Connelly said that he understood and wanted to talk because his conscience bothered him. The following day, however, he showed signs of serious mental disorder: he was disoriented, gave confused answers, and said that "voices" told him to confess. He was hospitalized, and only after 6 months of treatment was he found to be competent to proceed. At a hearing, a psychiatrist testified that Connelly was suffering from chronic schizophrenia at the time he confessed and that he had been "reluctantly" following hallucinatory commands. In this way his mental condition interfered with his capacity to exercise "free and rational" choice. The court then ruled that a confession was admissible "only if it is a product of the defendant's rational intellect and free will," and that Connelly's illness destroyed his volition and compelled him to confess.

The Colorado Supreme Court confirmed the decision, relying on the due process clause of the Fourteenth Amendment, which the court concluded would require the state to reject a confession that was not given of the defendant's "free will." The U.S. Supreme Court reversed the Colorado decision, holding that the admissibility of a confession is governed by state rules of evidence rather than by *Miranda* or other decisions involving police misconduct.

Writing for the majority, Chief Justice Rehnquist emphasized that the court's prior decisions in this area involved police coercion or "overreaching." Without a demonstration of police misconduct, Rehnquist found no basis for concluding that the state had deprived the defendant of due process of law. He rejected the idea that the defendant's mental condition alone rendered his confession "involuntary"; the Colorado Supreme Court had therefore erred in invoking the idea of "free will." Rehnquist thus restricted the concept of voluntary confession to mean only that the confession was made without intimidation, coercion, or deception.

Justice Stevens concurred with the majority in part but made a distinction between pre-custody and post-custody statements, arguing that placing a person in custody in itself introduced an inevitable element of coercion. He noted that it was undisputed that Connelly was not competent to stand trial after he was in custody and that he was therefore not competent to waive his rights at that point.

Justice Brennan dissented from the entire decision: he argued that the Constitution guarantees a "Fundamental right to make a vital choice with a sane mind." He quoted the *Miranda* decision itself to the effect that a "heavy burden rests on the government to demonstrate that the defendant knowingly and intelligently waived his privilege against self-incrimination." Brennan considered the majority opinion to be a step toward a system of law enforcement that would be inquisitional rather than adversarial, with the result that the process would be less reliable and more open to abuse.

Ford v. Wainwright, 106 S.Ct. 2595 (1986)

In *Ford v. Wainwright*, a divided Supreme Court addressed the issue of a mentally impaired person's competence to be executed. Alvin Ford had been convicted of murder in Florida in 1974 and was sentenced to die. Several years later he began to show signs of serious mental disorder, developing grandiose paranoid delusions and coming to believe that he had won a landmark case against the state, so that he could not be executed. A psychiatrist evaluated him over a period of 14 months and concluded that he was psychotic. Ford then refused to see this psychiatrist again, believing he was conspiring against him. A second psychiatrist examined him and concluded that he had no understanding of why he was to be executed and in fact did not believe that he would be, since he could control the state's governor through mind waves.

Florida law proscribed the execution of the insane and required the governor to determine if an apparently insane condemned person "has the mental capacity to understand the nature of the death penalty and the reasons why it was imposed on him." The state therefore appointed three psychiatrists who examined Ford together for a total of 30 minutes. The psychiatrists found him competent to be executed.

Ford's counsel filed a writ of habeas corpus in federal court, seeking a hearing on the issue of Ford's competence. The district court denied the request and was upheld by the Court of Appeals. The Supreme Court heard the case and focused on two issues: first, whether the Eighth Amendment itself barred the execution of the insane; and second, whether Florida's procedure satisfied the requirements of due process.

Writing for a plurality of four justices, Justice Marshall's opinion held that the Eighth Amendment did bar the execution of the insane and that Florida's procedure did not give Ford a fair hearing. The court reversed the Court of Appeals and remanded the case for a hearing on the evidence of Ford's competence.

Marshall reviewed a long history of opinion in common law (going back to Coke and Blackstone) that insanity barred execution. He quoted Coke to the effect that it "offends humanity" to execute the insane and argued that such executions neither make sense as retribution nor provide any example to others as a deterrent. He noted that no state allows the execution of the insane and concluded that to sanction it would be "cruel and unusual punishment."

On the procedural issue, Marshall argued that capital cases require a higher standard of reliability in fact finding and that "death is different" because it is irremediable. Marshall invoked the principle that the fact finder must have all the relevant information to make a decision. Florida failed to ensure Ford's fundamental right to be heard because the defense submission of two additional psychiatric reports was given no attention. The governor had an announced policy of excluding any "advocacy" on the issue of competence to be executed, and the entire determination of the issue was carried out within the executive branch. The denial of any opportunity for the defense to challenge state witnesses also resulted in an inadequate assurance of accuracy in the proceeding.

Justice Powell provided the fifth vote for the majority in concurring that executing the insane was "uniquely cruel" and in finding the Florida process defective. He agreed that the "essence of a 'court' is independence from the prosecutorial arm of government." He departed from Marshall only in his opinion that due process did not require a "full-scale" competency trial. A flexible concept of due process might be accommodated by another arrangement, such as an independent review board.

Justice O'Connor concurred in the result, but argued that the Florida statute and not the Eighth Amendment barred the execution. She agreed that the Florida procedure was constitutionally defective. Justice Rehnquist, joined by Chief Justice Burger, dissented and made the point that the same common-law tradition on which Marshall relied had always assigned to the executive the responsibility to determine the sanity of the condemned—the governor being the prisoner's custodian.

Godinez v. Moran, 113 S.Ct. 2680 (1993)

Godinez v. Moran established the principle that there is only a single standard for competence to stand trial. The decision effectively overruled *Sieling v. Eyman*, 478 F.2d 211 (1973). Richard Moran was arrested after a crime spree in which he killed three people and then shot himself in a suicide attempt. Two psychiatrists examined Moran and found him to be competent to stand trial. About two-and-a-half months later, Moran asked the trial court to dismiss his attorneys and allow him to plead guilty. He offered the explanation that he wanted to stop any presentation of mitigating evidence in his case. The court accepted Moran's guilty plea, and he was subsequently sentenced to death for the three murders.

Some 18 months later, Moran filed a claim with the court that he had been mentally incompetent to represent himself at the time of his guilty plea. After the state court rejected this claim, he filed a habeas corpus petition with the U.S. District Court, which denied his petition. On appeal, however, the Ninth Circuit Court of Appeals reversed the decision. The Ninth Circuit Court concluded that the record available to the trial court should have led that court to question Moran's competence to make a voluntary waiver of important rights. The court held that competence to waive constitutional rights requires a higher level of mental functioning than is required for competence to stand trial. The court reasoned that the "rational and factual" understanding required by *Dusky v. U.S.*, 362 U.S. 402 (1960) was not the same as having a capacity for "reasoned choice."

Justice Thomas, in his opinion for the majority in the Supreme Court, rejected the Ninth Circuit ruling and reaffirmed Moran's conviction. Thomas argued that there was no meaningful distinction between "rational and factual understanding" and "reasoned choice." He also concluded

that there could be only one standard for competence in criminal cases. He pointed out that all criminal defendants are faced with important decisions, especially the decision whether to plead guilty or not guilty. While pleading guilty is undoubtedly an important decision, Thomas reasoned that it is no more complex than other decisions that defendants have to make. If the *Dusky* standard is adequate to allow a person to plead "not guilty," it logically must be adequate for the person to plead "guilty." The decision to waive the right to counsel like-wise demands no more mental capacity than other decisions. Thomas also emphasized the fact that, besides being competent, a waiver of rights must also be "knowing and voluntary." (This formulation parallels the standard formulation for informed consent, which requires a person to have capacity, knowledge, and voluntariness.) Thomas conceded that while this formulation could be construed as a higher standard for pleading guilty or waiving rights, it is *not* a higher standard for *competence*.

Justice Kennedy offered a concurring opinion, in which he emphasized the idea that the standard for competence should not be confused with the *occasion* for its application. He noted that the requirement for competence applies throughout all phases of the trial process and that the trial court has an obligation to address the issue of the defendant's competence at any point where significant doubts about it might arise. (Kennedy's opinion is curiously silent about the question of why Moran's desire to prevent any mitigating evidence from being presented did not constitute an occasion for further inquiry into his competence.)

Justice Blackmun, in dissent, accepted the Ninth Circuit requirement for a higher standard of competence to waive constitutional rights. Blackmun pointed out that the initial psychiatric reports that found Moran to be competent also contained a clear warning that he was filled with guilt and remorse and that he might not be disposed to make an effort to defend himself. Blackmun argued that the court had indeed disregarded evidence of Moran's disturbed mental state at the time he pled guilty. Blackmun concluded that it would not be an excessive burden on trial courts to require a specific inquiry about competence at the point where a defendant with a history of mental disorder seeks to waive the right to counsel.

Cooper v. Oklahoma, 116 S.Ct. 1923 (1996)

In *Cooper v. Oklahoma*, the Supreme Court addressed the issue of whether a criminal defendant's Fourteenth Amendment rights were violated by an Oklahoma statute that presumed a defendant to be competent unless he was able to prove his incompetence by clear and convincing evidence.

Byron Cooper was convicted of murdering an 86-year-old man in a burglary and was sentenced to death. During the course of these criminal proceedings, the issue of his competence to stand trial was raised five times. During the pretrial phase a state psychologist examined him and found him to be incompetent, and he was sent to a state mental health facility for treatment. After his hospitalization, two psychologists offered conflicting opinions about his competence. Having reviewed their evaluations, the court found Cooper to be competent. Subsequently, the defense attorney again raised the issue that Cooper was refusing to communicate, but the court declined to re-open the issue of his competence. During his trial the defendant showed signs of bizarre behavior: he was observed to be talking to himself and to "spirits," and he began to fear that his attorney wanted to kill him. A new competency hearing was held, at which a third psychologist testified that Cooper again was incompetent. The court, however, again ruled that he was competent. The judge noted that his "shirtsleeve opinion" was that Cooper was not "normal" but that "to say he's not competent is something else." The judge went on to suggest that it was possible for a client to be unable to help with his defense but still to be competent. He concluded that it would take "smarter people than me" to answer such a question, but he ruled that the defense had failed to prove by clear and convincing evidence that Cooper was incompetent. Finally the defense moved for a mistrial or a re-investigation of the defendant's competence, but these motions were denied.

Cooper's conviction was appealed to the Oklahoma Court of Criminal Appeals, where the defense argued that the clear and convincing standard of proof violated the Due Process clause of the Fourteenth Amendment. The court rejected this appeal, and the United States Supreme Court agreed to hear the case. The Supreme Court reversed the Oklahoma Court's decision, holding that the Oklahoma law did violate due process. In effect the law allowed the state to try a defendant who was more likely than not to be incompetent.

The court's reasoning was based on the premise that trying an incompetent person would violate due process. The state is allowed to presume that a person is competent and to put the burden on the defendant to prove his incompetence by a preponderance of the evidence. In this case, however, the defendant was put on trial after he had already shown that he was more likely than not incompetent. The court considered this error to amount to a matter of "fundamental fairness," where the risk to the defendant outweighed any interest the state could have in the efficient prosecution of the case. Although the risk of malingering justifies placing the burden of proof on the defendant, it does not justify a higher standard of proof beyond a preponderance of the evidence.

The court pointed to the case of *Medina v. California,* 505 U.S. 437 (1992) as the basis for placing the burden of proof on the defendant. It then observed that only four states have required proof of incompetence by clear and convincing evidence. Some states in fact require the prosecution to prove that the defendant is *competent*. The court rejected Oklahoma's attempt to invoke *Addington v. Texas*, which required a standard of clear and convincing evidence in civil commitment cases. The court reasoned that civil commitment and criminal competence were entirely different issues and that the ruling in *Addington* was designed to *protect* the individual's liberty interests, not to limit them.

Indiana v. Edwards, 554 U.S. 164 (2008)

In *Indiana v. Edwards*, the Supreme Court revisited whether or not the standard for competence to stand trial equals the standard for competence to proceed *pro se*. More specifically, the court entertained the question, "whether in these circumstances, the Constitution prohibits a state from insisting that the defendant proceed to trial with counsel, the State thereby denying the right to represent himself."

In 1999, Mr. Edwards entered a store and attempted to steal a pair of shoes; store security witnessed the attempted theft and pursued Mr. Edwards, who in turn pulled a gun and fired, wounding one of the security officers and a bystander. He was apprehended and charged with multiple felonies, including attempted murder, battery with a deadly weapon, criminal recklessness, and theft. Mr. Edwards suffered from schizophrenia, and underwent three evaluations of his fitness to proceed. In August 2000, he was found unfit; in March 2002, he had regained competence to stand trial. However, in November 2003 he was found unfit to proceed again. By June 2004, he was again fit, and in June 2005, on the eve of trial, Mr. Edwards requested to dismiss counsel and represent himself. The Indiana trial court refused his request, and Mr. Edwards proceeded to trial with counsel. He was convicted on charges of criminal recklessness and theft, but the jury could not reach a verdict on the attempted murder and battery charges.

In December 2005, the state retried Mr. Edwards on the attempted murder and battery charges, and again, Mr. Edwards requested to represent himself at trial. The court again denied his request, finding that Edwards continued to suffer symptoms of schizophrenia, and "[w]ith these findings, he's competent to stand trial but I'm not going to find he's competent to defend himself." Mr. Edwards again proceed to trial with counsel; the jury found him guilty of both charges.

Mr. Edwards appealed to the Indiana intermediate appellate court, arguing a deprivation of his Sixth Amendment right, and the appellate court agreed, and ordered a new trial. The state appealed the decision, and the Indiana Supreme court upheld the decision of the appellate court, citing the U.S. Supreme Court precedent cases *Faretta v. California* and *Godinez v. Moran*. The U.S. Supreme Court granted *certiorari*.

The majority held that the Constitution does not prohibit a state from insisting a defendant proceed to trial, or, stated differently, a state may limit a defendant's right to self-representation, if the court does so after "a realistic account of the particular defendant's mental capacities by asking whether a defendant who seeks to conduct his own defense at trial is mentally competent to do so." To reach this conclusion, the court addresses *Faretta* and *Godinez*, concluding that though these cases frame the question at hand, they do not answer it. The majority maintained that while *Faretta* found "a constitutional right to proceed without counsel" when a criminal defendant "voluntarily and intelligently elects to do so" rooted in the Sixth Amendment, the case did not address the issue of mental competence, and also acknowledged limits to this right in other circumstances. In *Godinez,* the court concluded, a related but distinct question was at issue: whether a defendant was competent to waive his right to counsel in order to enter a guilty plea, as opposed to represent himself at trial: "the competence that is required of a defendant seeking to waive his right to counsel is the competence to waive the right, not the competence to represent himself."

The majority went on to make three core arguments. First, the court argued that competence to consult with an attorney is different than performing as an attorney. Second, in support, the court cited briefs by the American Psychiatric Association, which state that "symptoms of severe mental illness can impair the defendant's ability to play the significantly expanded role required for self-representation even if he can play the lesser role of represented defendant." Third, the court maintained that allowing a defendant who is not competent to represent himself to do so is not fair, in reality and in appearance. Importantly, though, the court demurred from articulating a standard for competence for self-representation at trial. The dissent emphasized a citizen's right to self-representation as fundamental as captured in the Sixth Amendment, and stressed that "the defendant's choice must be honored out of 'that respect for the individual that is the lifeblood of the law'…What the Constitution requires is that a defendant be given the right to challenge the State's case against him using the arguments he sees fit." The dissent did not dispute that waiving counsel knowingly and voluntarily is most likely foolish, but argued "the dignity at issue is the supreme human dignity of being master of one's own fate rather than the ward of the state—that of individual choice." The dissent provided additional information to support a conclusion that though mentally ill, Mr. Edwards' requests to represent himself were not a product of his mental illness but rather sprang from disagreements with his counsel about the best defense to put forward at trial. The dissent also drew attention to the potential harms of the majority's decision to those who suffer from mental illness: "At a time when all society is trying to mainstream the mentally impaired, the Court permits them to be deprived of a basic constitutional right—for their own good."

HYPNOSIS

State v. Hurd, 414 A.2d 291 (1980)

Paul Hurd, the defendant in an assault case, filed a motion in a New Jersey superior court to suppress the victim's identification of him in court because she had been hypnotized. The defendant was divorced from the victim, who had later remarried. He was charged with having broken into her home at night and with stabbing her numerous times with a knife, while her current husband slept nearby. Immediately after the attack, the victim was unable to identify the perpetrator, and referred to him as a "stranger," but she also suggested to the police that they "check out" her ex-husband. The prosecutor arranged for the victim to be examined by a psychiatrist, who hypnotized her in the presence of police

officers. Her current husband was meanwhile outside in the waiting room. Six days after hypnosis, the victim made a statement identifying Hurd as her attacker.

The issues in the case were (1) whether a victim could be allowed to make an identification in court after she had been unable to do so prior to hypnosis; (2) whether hypnosis was reliable enough to be used for memory enhancement; and (3) whether the method used in this particular case was unnecessarily suggestive, so that the identification should be suppressed.

The court granted the defendant's motion to suppress the identification, ruling that hypnotically induced recollection could only be admitted in testimony under strictly limited conditions, which the court enumerated:

1. Hypnosis must be done by a licensed M.D. or Ph.D. trained in hypnosis.
2. The hypnotist must be independent of the parties in the case.
3. Only written information should be given to the hypnotist prior to the hypnosis.
4. The hypnotist should independently obtain the subject's recollections of the facts prior to initiating hypnosis.
5. All contacts by the hypnotist with the witness should be recorded.
6. Only the hypnotist should be present during the interviews.

The court relied in its opinion on the expert testimony of Dr. Martin Orne. Dr. Orne indicated that hypnotic recall is often unreliable and that a hypnotized subject is highly vulnerable to suggestion, is likely to have diminished critical judgment, and may fill in gaps in memory by confabulation when pressed to give an answer. Once suggestions are made, Dr. Orne said, it is impossible to distinguish between confabulation and accurate details. Dr. Orne also testified that the procedure used in this case was in fact clearly suggestive of the identification of Hurd as the assailant. He also maintained that the presence at the doctor's office of police officers and the current husband (who had himself been a possible suspect) tended to point the finger at Hurd, and that the victim was in fact an unreliable witness, as indicated by her contradicting herself.

The court relied on *Frye v. United States*, 293 F. 1013 (1923), for the standard for judicial acceptance of scientific evidence: the reliability of a procedure must be shown to have received general acceptance in the scientific community for the procedure to be admitted in evidence. The court reasoned that the expert testimony made it clear that hypnosis did not receive such general scientific acceptance for the purpose of memory enhancement.

People v. Shirley, 181 Cal. Rptr. 243 (1982)

In *People v. Shirley*, the California Supreme Court addressed the question of whether the testimony of a witness should be admitted in a criminal trial after the witness had undergone hypnosis to enhance her memory. The court held that such testimony could not be admitted in California.

Catherine C. was the complaining witness in a rape trial. She testified that the defendant had threatened her with weapons and compelled her to submit to intercourse. The defendant in contrast testified that Catherine C. had invited him into her home and had willingly engaged in consensual sex. Prior to the trial, the prosecutor had had Catherine C. hypnotized for the purpose of "filling in the gaps" in her story. During the trial her performance was erratic: she gave self-contradictory testimony and had lapses of memory, even being unable to recall what she said on the witness stand one day previously. In spite of these inconsistencies, the jury convicted the defendant of rape. In overturning the conviction, the California Supreme Court ruled that it was an error to allow Catherine C. to testify after having undergone hypnosis.

The record indicated that the witness made different statements in her testimony at trial compared to her statements in a preliminary hearing. The defense had moved to exclude all testimony that resulted from the hypnosis. The trial court, however, ruled that the hypnosis only affected the weight that should be given to this evidence, not to its admissibility. At the trial, the defense called a psychiatrist to testify as an expert. He made several points about the unreliability of memories enhanced by hypnosis: first, that there is no assurance that the memory would be correct; second, that any motive to distort the truth could still operate under hypnosis; third, that hypnosis might give the witness implicit permission to believe in such a distortion; and finally that hypnosis can have the effect of making the witness more convinced that her memory was valid.

The California Supreme Court did an extensive review of court decisions regarding hypnosis and also reviewed the psychiatric literature regarding the validity of hypnotically enhanced memory. The court found a widespread consensus that hypnotically enhanced testimony is not reliable. It cited *Frye v. United States,* 293 F. 1013, as the standard for admissibility of scientific evidence. The *Frye* rule stated that evidence based on a scientific technique is admissible if the technique has gained general acceptance for reliability in the scientific community. In reviewing the record of court decisions in the preceding decade, the court found a gradual change in the approach of the courts. In early cases, the courts tended to follow the rule articulated by the trial court in *Shirley*, that hypnosis constituted an issue in weighing the evidence but not in its admissibility. In more recent cases, however, courts had become increasingly concerned about the dangers of introducing hypnotically refreshed testimony. The court noted the approach of *State v. Hurd,* 414 A.2d. 291, which it characterized as formulating "an intricate set of procedural prerequisites" for the use of hypnosis. The court concluded that even such a set of safeguards could not forestall the problems inherent in the use of hypnosis. The *Hurd* rules were largely aimed at avoiding the problem of suggestibility in the hypnotic interview, but these rules did not address the fact that the witness could lose critical

judgment about her own memory or still confuse actual memory with confabulation or show unjustified confidence in the correctness of her memory. The court concluded that its review of scientific literature indicated that hypnosis as a memory enhancement technique did not meet the *Frye* test of general acceptability.

The court made one exception to its ruling, which anticipated the case of *Rock v. Arkansas*, 107 S.Ct. 2704. When the defendant is the witness who has submitted to hypnosis, his testimony remains admissible because of his fundamental right to testify in his own behalf.

Rock v. Arkansas, 107 S.Ct. 2704 (1987)

Vickie Lorene Rock was convicted of manslaughter in the death of her husband. She appealed her conviction, arguing that the state of Arkansas, in excluding her own hypnotically refreshed testimony from her trial, had infringed on her constitutional right to testify on her own behalf.

In the context of "simmering" marital disputes, Rock and her husband had a fight over his refusal to let her leave their apartment to get something to eat. The husband was shot, and when the police arrived, Rock told them that her husband had choked her and thrown her against the wall; that she picked up a pistol; that he hit her again; and that she shot him. Because she could not recall precise details of these events, her attorney arranged for her to be hypnotized, after which she remembered having her thumb on the hammer of the pistol but not having her finger on the trigger. She then stated that the gun discharged when her husband grabbed her. A firearms expert also offered an opinion that the gun was defective and prone to fire when struck.

The trial court, operating under an Arkansas rule that no hypnotically refreshed testimony was admissible, allowed the defendant to testify only to those details that she had recalled prior to hypnosis, as documented by the hypnotist's sketchy notes. As she testified the prosecutor repeatedly objected, and was sustained, when she mentioned anything that went beyond the doctor's notes. The defendant was then convicted.

On appeal to the Supreme Court, the issue was whether Arkansas' *per se* rule excluding hypnotically refreshed testimony was unconstitutional. The Supreme Court concluded that in this instance the rule did amount to a violation of the defendant's rights under the Fifth, Sixth, and Fourteenth amendments. The court held that the defendant's right to testify in her own behalf derived from several sources in the Constitution. The due process requirement of the Fourteenth Amendment includes the right to be heard. The choice to testify is also a necessary corollary of the Fifth Amendment, i.e., the defendant has the privilege of either testifying or refusing to do so. Finally the Sixth Amendment was designed to ensure that the testimony of witnesses on the defendant's behalf should be admissible. The court reasoned that the most important witness for the defense might be the defendant herself and therefore that any severe limits on her testimony could vitiate her ability to present a defense.

The majority pointed out that the right to present testimony is not unlimited, but that restrictions imposed by the state may not be "arbitrary or disproportionate to the purposes they are designed to serve." The state has an obligation to weigh the interests served by its rule (e.g., preventing erroneous evidence), to justify the limitations imposed on the defendant's rights. There are additional safeguards for the judicial process, however (e.g., the veracity of hypnotically refreshed testimony can still be tested by cross-examination). The Arkansas rule fails because it does not allow the trial court even to consider posthypnotic recollections and effectively prevented this defendant from describing the events of the shooting at all.

A dissent by four justices emphasized the unreliability of hypnosis as a technique for memory enhancement and suggested that the majority would require the trial court to make a scientific assessment of the reliability of the testimony in each case, an assessment that the dissenters implied was beyond the competence of the courts.

CRIMINAL RESPONSIBILITY

M'Naghten's Case, 8 Eng. Rep. 718, 722 (1843)

The *M'Naghten* case is by far the oldest case currently designated as a landmark. The furor surrounding M'Naghten's acquittal in this case during the reign of Queen Victoria was comparable to the more recent furor in this country regarding the Hinckley verdict. Because of her concern over the threat of assassination, the Queen was instrumental in having the case re-examined by the House of Lords.

Daniel M'Naghten suffered from a paranoid psychosis, in which he believed that he was being persecuted by the Tory party. Medical testimony in his trial indicated that he believed that he was being stalked and persecuted by Tories, who wanted to murder him. On January 20, 1843, he shot and killed Edward Drummond, who was the secretary to the Prime Minister, Robert Peel. The prosecution portrayed the case as one of deliberate political assassination, arguing that M'Naghten intended to shoot Peel and only killed Drummond by mistake. The defense portrayed M'Naghten as an insane person who had been in a state of terror, believing he was being threatened by the Tories, and who had not known whom he was shooting, believing that Drummond was only one of the conspirators against him. Defense experts testified that M'Naghten was delusional and that he was incapable of exercising control over acts connected to his delusions. After hearing the expert testimony, the jury acquitted M'Naghten on the ground of insanity.

The House of Lords directed several questions to Her Majesty's Judges (who served a function somewhat analogous to a Supreme Court in resolving issues of law). The crucial issue was to define the standard for insanity, where a person suffered from delusions but might also have known that he

was acting contrary to the law. What if the defendant, acting on a delusion, was attempting to get revenge for some grievance or to produce some (delusional) benefit to society? Lord Chief Justice Tindal presented the conclusion of the judges, which constitutes the original formulation of the "M'Naghten Rule": for a defendant to be found insane, "it must be clearly proved that, at the time of the committing of the act, the party accused was laboring under such a defect of reason, from disease of the mind, as not to know the nature and quality of the act he was doing; or, if he did know it, that he did not know he was doing what was wrong." It must be left to the jury to decide, in a particular case, whether the defendant had a sufficient degree of reason to know that what he was doing was wrong. Tindal went on to explain that the answer to this question would depend on the nature of the delusion. The defendant must be judged "as if the facts with respect to which the delusion exists were real." Therefore, if the man believed his life to be threatened and acted in an effort to defend himself, he might be found not guilty; if he acted only from a sense of injury and sought revenge, he would still be culpable.

It is interesting to speculate as to whether the articulation of the "M'Naghten Rule" would actually have made any difference to the jury in judging M'Naghten. The trial court's actual instructions to the jury were in fact hardly distinguishable from the rule in its ultimate form: "The question to be determined is, whether at the time the act in question was committed, the prisoner had or had not the use of his understanding, so as to know he was doing a wrong or wicked act."

Durham v. United States, 214 F.2d 862 (1954)

Durham represented an effort by Judge David Bazelon and the U.S. Court of Appeals for the District of Columbia Circuit to redefine the test for insanity in a criminal case. The case is now mainly of historical significance: it reflects a conceptual development in judicial thinking about insanity but had only limited practical effect as a precedent. In 1972 the court overturned its *Durham* rule in deciding *United States v. Brawner* (471 F. 2d 969).

The Court of Appeals addressed two issues in *Durham*: first, whether the trial court had applied the rules on the burden of proof incorrectly, and second, whether the existing test of insanity was obsolete. Monte Durham had presented an insanity defense in his trial for housebreaking. He had a long psychiatric history that included, at different times, diagnoses of personality disorder and psychosis, with episodes of antisocial behavior, attempted suicide, and psychiatric hospitalization. At his trial, the court rejected his insanity defense on the grounds that Durham had failed to establish that he did not know the difference between right and wrong or that he was subject to an irresistible impulse (these two tests constituting the accepted rules in the District of Columbia Circuit at the time). The trial court found that because there was no testimony about his state of mind on the day of the offense, the usual presumption of insanity would therefore hold.

Bazelon's opinion rejected this logic, reversing Durham's conviction and remanding the case for a new trial. On the burden of proof issue, Bazelon pointed out that the prosecution is not required to prove the defendant's sanity until "some evidence of mental disorder is introduced." At that point, however, sanity had to be proved by the prosecution beyond a reasonable doubt. Although the trial court apparently did not see evidence of insanity, Bazelon found the testimony of the only expert witness to be "unequivocal" that Durham was of unsound mind at the time of the crime. (The prosecution had presented no expert testimony in rebuttal.) Bazelon criticized the trial court for restricting the psychiatric testimony to an all-or-nothing type of response: "The inability of the expert to give categorical assurance that Durham was unable to distinguish between right and wrong did not destroy the effect of his previous testimony that the period of Durham's insanity embraced" the day of the offense.

After reviewing the historical development and establishment of the right–wrong test in most American jurisdictions, Bazelon maintained that the rule must change with new scientific knowledge: modern psychiatry recognized the individual as an integrated personality from which "reason" cannot be abstracted as an isolated element that determines conduct. Bazelon concluded that the "fact finder should be free to consider all information advanced by relevant scientific disciplines." He went on to set out a deliberately broad rule: that a defendant was "not criminally responsible if his unlawful act was the product of mental disease or mental defect." Bazelon thus invited psychiatrists to testify expansively, while specifically reserving for the jury the ultimate questions of insanity and moral responsibility.

Washington v. United States, 390 F.2d 444 (1967)

In *Washington v. United States*, the U.S. Court of Appeals for the District of Columbia Circuit went beyond *Durham v. U.S.* (214 F.2d 862, 1954) in elaborating its critique of psychiatric expert testimony in insanity cases. The court criticized both lawyers and witnesses for over-reliance on medical jargon, and it offered specific suggestions for how experts should testify.

Washington had been convicted of rape, robbery, and assault after having presented an insanity defense. The Court of Appeals upheld the conviction, on the grounds that the jury did hear at least a minimum amount of information to be able to decide the issue of sanity. In writing the opinion, however, Chief Judge Bazelon suggested that the jury might have been "hindered" by the psychiatrists' use of jargon, and much of his opinion then dealt with this issue.

Judge Bazelon briefly reviewed the history of how the "product" test in *Durham* had been intended to widen the range of expert testimony in order to provide juries with more extensive scientific information. Bazelon observed that *Durham* had been mistakenly interpreted as excusing from

criminal responsibility anyone classified by the psychiatric profession as mentally ill. He emphasized that psychiatrists have no such classification as to what is an excusing condition; therefore, expert opinion should not bind a jury in its conclusions. He pointed out that the Court of Appeals had given a legal definition of mental illness in *McDonald v. United States* (312 F.2d 851 1962)—that is, "any abnormal condition of the mind which substantially affects mental or emotional processes and which substantially impairs behavior control." (The word *any* made clear that the concept of insanity was not tied to particular diagnoses.)

Bazelon maintained that in Washington's trial the use of psychiatric labels without behavioral data gave the jury a very limited basis for its decision; psychiatrists testified as to their conclusions based on only single interviews, and the jury did not hear detailed data from hospital observation. What the jury did hear was a "confusing mass of abstract philosophical discussion" of legal and psychiatric labels, including confusing definitions of terms like "neurosis," "schizoid," "sociopath," and "irresistible impulse."

Part of the court's purpose in *Durham* and *McDonald* was to clarify the responsibility of expert witnesses for giving explanatory descriptions of mental conditions and to keep separate the legal question of culpability from the medical concept of illness. Bazelon instructed trial judges to limit the expert's use of labels and to ensure that their meaning was explained when they were necessary. He explicitly dropped his endorsement of *Durham's* "product" test, now concluding that the concept had no clinical meaning to psychiatrists, and that psychiatrists should not be testifying about the ultimate issue of sanity.

Bazelon's appendix included suggestions that many forensic psychiatrists might question: for example, that psychiatrists should not concern themselves with the legal meaning of "mental disease," and that they should give explanations in court in the same fashion as they would to the family of a patient.

People v. Patterson, 383 N.Y.S.2d 573 (1976)

In *People v. Patterson*, New York State's highest court had to deal with the distinction between "extreme emotional disturbance" and other, apparently similar, "diminished capacity" or "heat of passion" defenses. The specific issue in the case was whether New York violated due process rights by placing the burden of proof on the defendant in a murder case, requiring him to show that he acted under extreme emotional disturbance.

Gordon Patterson had killed a man whom he found with his estranged wife in a state of "semi-undress." The state tried and convicted Patterson under a statute that allowed, as an affirmative defense to the charge of murder, the argument that the defendant acted under the influence of "extreme emotional disturbance for which there was a reasonable explanation or excuse, the reasonableness of which is to be determined from the viewpoint of a person in the defendant's situation under the circumstances as the defendant believed them to be." Proof of this disturbance by a preponderance of the evidence meant that the defendant would be convicted only of manslaughter, not murder.

The New York State Court of Appeals held that Patterson's conviction did not violate due process. The court ruled that the state always has the burden of proving every element of a crime, including intent; as long as the state does so, the burden can be placed on the defendant to show that he formed that intent under the influence of extreme emotional disturbance.

The court reasoned that extreme emotional disturbance does not contradict intent but rather serves to *explain* the defendant's intentional action. The concept of such a disturbance includes more than sudden, spontaneous reactions: "it may be that a significant mental trauma has affected a defendant's mind for a substantial period of time, simmering in the unknowing subconscious and then inexplicably coming to the fore." The court distinguished this case from the Supreme Court's decision in *Mullaney v. Wilbur* (421 U.S. 684) where the court held that due process did require a prosecutor in Maine to prove the *absence* of "heat of passion" for a murder conviction. After making a detailed historical review of the differences between the statutory definitions of murder and manslaughter in Maine and New York, the New York Court of Appeals pointed out that the New York legislature had discarded the concepts of "premeditation" or "deliberation," requiring only proof of intent in its current definition of murder. In Maine, the "heat of passion" would by definition negate intent, because "malice" or "premeditation" was logically inconsistent with the "heat of passion"; if the defendant acted with premeditation, he could therefore not be responding to a sudden, inflammatory provocation. In New York, by contrast, the presence of extreme emotional disturbance does not make the act any less intentional.

Frendak v. U.S., 408 A.2d 364 (1979)

Paula Frendak was convicted of murder after a jury trial in the District of Columbia. Prior to her trial she had been given varying diagnoses (schizophrenia or borderline personality) and was found to be incompetent to stand trial on two occasions. After she was eventually found to be competent, the trial court held a hearing regarding her sanity at the time of the crime, and the court decided to impose the insanity defense over the defendant's objection. At trial, the jury found the defendant to be not guilty by reason of insanity (NGRI). The court had based its decision on *Whalem v. U.S.* (120 U.S. App. D.C. 331), where the Court of Appeals for the D.C. Circuit had held that a trial judge does have discretion to raise the insanity defense over the objection of the defendant, even if the defendant is competent to stand trial. Frendak challenged the validity of this ruling.

On hearing Frendak's appeal, the Court of Appeals for the D.C. Circuit re-interpreted *Whalem* and held that the trial judge may not force the insanity defense on a competent defendant as long as the defendant had waived the defense in an intelligent and voluntary manner. The court held that

competence to stand trial was not sufficient in itself to allow such a waiver. The trial judge was required to make a further assessment into the intelligence and voluntariness of the decision. Because it was unclear as to whether Frendak had in fact made such a waiver, the case was remanded to the trial court for a decision on that issue.

In reaching its decision in Frendak's case, the court had to deal with the question of whether *Whalem* had been affected by two other Supreme Court decisions: *North Carolina v. Alford,* 400 U.S. 25 (1970) and *Faretta v. California,* 422 U.S. 806 (1975). These two cases stood for the proposition that the defendant has the right to make key decisions in her own case. *Alford* held that it was not unconstitutional for a judge to accept a guilty plea from a defendant who maintained that he was in fact innocent. The court reasoned that a defendant might have a valid reason for wanting to plead guilty, e.g., to get a shorter sentence, even while claiming to be innocent. In *Faretta*, the Court ruled that the Sixth Amendment gives the defendant the right to control his or her defense, including the right to represent himself or herself without a state-imposed attorney. The court pointed out that *Alford* does not give the defendant an absolute right to have a guilty plea accepted and that *Faretta* does not allow the defendant to control all aspects of the defense. Following these precedents, however, the court in *Frendak* reasoned that the defendant might have a valid interest in not wanting to make an insanity defense (e.g., not wanting to be confined in a hospital for a longer period of time than the potential prison sentence). This interest would outweigh the abstract concept of justice that is articulated in *Whalem*, i.e., the state's interest in protecting a morally blameless person from conviction. The court indicated that it was not abolishing *Whalem* but only limiting the discretion of the trial court, which must defer to the defendant's decision about the insanity defense as long it was intelligently and voluntarily made. The criteria for judging this decision would be whether the defendant was fully informed of her alternatives and understood the consequences of the choice.

Ibn-Tamas v. United States, 407 A.2d 626 (1979)

Ibn-Tamas v. United States expanded the scope of expert testimony about spousal abuse that could be considered relevant in a homicide trial. Beverly Ibn-Tamas had been convicted of the murder of her husband in the Superior Court of the District of Columbia. The defense alleged that her husband, a physician, was a violent man who had assaulted his wife on numerous occasions and had threatened her with a gun in the past. In 1976, while the defendant was pregnant, there was another argument and assault, during which she shot and killed him. She then asserted in her defense that she had felt in imminent danger due to his repeated threats and violence. She testified that prior to the shooting, her husband had again struck her and threatened her with a pistol. A witness for the prosecution provided a different account, which suggested that the husband had begged for mercy before the final shot. This testimony raised a serious question about the assertion of self-defense.

The defense offered the testimony of a psychologist on the subject of the battered wife syndrome and elicited her expert opinion as to whether Ibn-Tamas fitted the pattern of a battered woman. It argued that the testimony was relevant, because it would help the jury to determine the credibility of the claim that she perceived herself in imminent danger from her husband and shot him in self-defense.

The trial court excluded the testimony for three reasons: that it included past violent acts that the jury was not entitled to hear about; that it invaded the province of the jury in judging the facts and the credibility of the defendant; and that the expert necessarily concluded that the victim was a batterer.

The Court of Appeals for the District of Columbia reversed the decision and held that the expert testimony was not, in principle, inadmissible: the trial court should have been guided by the principle that the defense is free to introduce any expert testimony that is likely to aid the fact finder, as long as its probative value outweighs its prejudicial impact. The court concluded that the psychologist's testimony would not have invaded the province of the jury but rather could have supplied background information to help the jury determine the ultimate issue of guilt or innocence; and that she did not directly express an opinion on the ultimate issue. The court held that the expert testimony here was beyond the ordinary knowledge of the jury, so that its probative value did outweigh any prejudicial effect: it would be probative of Ibn-Tamas's perceptions at the time of the killing, a factor that was central to her claim of self-defense.

The court did not consider the trial record sufficient for it to decide that the expert testimony was actually admissible in this case. It remanded the case for further examination of the psychologist's credentials and for a determination as to whether her methods for evaluating the battered wife syndrome had achieved general scientific acceptance.

Ake v. Oklahoma, 470 U.S. 68 (1985)

In *Ake v. Oklahoma* the Supreme Court sanctioned a distinct expansion of the role of the psychiatric expert for the defense in insanity cases. Glen Burton Ake was arrested for murder in 1979. At his arraignment, a judge ordered a psychiatric examination because of bizarre behavior. A psychiatrist found him to be delusional and apparently schizophrenic, and the court committed him to a state hospital for examination of his competence to stand trial. Hospital psychiatrists initially advised the court that Ake was incompetent; subsequently he was found competent after being treated with 600 mg of Thorazine (chlorpromazine) per day. During his stay in the hospital, no examination was done with regard to his sanity at the time of the offense. When his attorney asked the court to arrange for such an examination, the judge denied the request. At trial, Ake presented an

insanity defense, calling as witnesses the psychiatrists who had examined him. Because none of the doctors had examined him as to his mental state at the time of the offense, there was no expert testimony about that issue. The judge instructed the jury that Ake should be presumed sane unless he presented evidence sufficient to raise a reasonable doubt about his sanity. The jury convicted him and sentenced him to death. The Oklahoma Court of Criminal Appeals then upheld the trial court's denial of the services of a psychiatric expert for the defense.

On appeal to the Supreme Court the issue was whether the Constitution required that Ake should have had access to a psychiatric examination for sanity and the assistance of a psychiatrist in the preparation of an insanity defense. In an opinion written by Justice Marshall, the court held that when an indigent defendant makes a preliminary showing that his sanity is likely to be a significant issue, the Fourteenth Amendment does require the state to provide access to such psychiatric services. The guarantee of due process of law depends on the idea that justice is not equal when an indigent person is denied a meaningful opportunity to defend himself. (In *Gideon v. Wainwright* [372 U.S. 335, 1963] the court had held the state responsible for providing legal counsel for indigent defendants.)

Marshall made clear that the defense would not be entitled to all the assistance money could buy, or to an expert of its own choice, but only to "adequate opportunity to present their claims fairly." In weighing the competing interests in the case, he noted that the defendant had a "uniquely compelling" interest in the accuracy of the criminal proceeding, and that the court was concerned with the risk of erroneous conviction; at the same time he found it an exaggeration for the state to claim that it would be a "staggering burden" to provide what Ake had requested. He noted that most other states already provided such assistance.

Marshall spelled out various ways in which a psychiatrist might be crucial to the defendant's case: to gather facts to be presented in court; to analyze the information and draw conclusions about how the defendant's mental state affected him; to identify "elusive" signs of mental disorder that a layperson would miss; and to help in framing questions for the prosecution's experts in cross-examination. With a touch of irony, Marshall pointed out that *Barefoot v. Estelle* (463 U.S. 880, 1982) had upheld the use of psychiatric testimony to determine future dangerousness in capital cases, with an explicit assumption that both the prosecution and the defense could present expert testimony on the issue.

Chief Justice Burger wrote a concurring opinion in order to make the point that the ruling specifically applied only to capital cases. Justice Rehnquist dissented, arguing that the facts of the case, for example, Ake's having indulged in a long, organized, purposeful crime spree prior to his arrest, provided evidence as to his sanity, so that additional psychiatric examination was not warranted. He also rejected the idea of a court-appointed defense psychiatrist serving as a "consultant" or "advocate" as opposed to the traditional independent expert.

Foucha v. Louisiana, 112 S.Ct. 1780 (1992)

In a sharply divided five-to-four decision, the Supreme Court ruled in *Foucha v. Louisiana* that a defendant found to be NGRI could only be committed to a psychiatric hospital as long as he continued to be both mentally ill and dangerous. Louisiana law at the time required an NGRI acquittee to be held in the hospital until a review panel found him to be no longer dangerous to himself or others. Once the review panel recommended the person's release, a court hearing would be held in which the defendant had the burden of proof to show that he was no longer dangerous.

Foucha had been convicted of burglary and illegal discharge of a firearm. He was found NGRI at trial in 1984. In 1988, the superintendent of the hospital where he was confined recommended that he be released, because he showed no evidence of having any mental illness since the time of his admission. The hospital suggested that he had probably suffered from a drug-induced psychosis at the time of the crime, and that he had now recovered. He continued to show signs of an antisocial personality, and one psychiatrist testified that he would not be comfortable saying that Foucha was not a danger to others. The court ruled that Foucha had not shown that he was no longer dangerous, and he was retained in the hospital. The state Supreme Court affirmed the lower court's decision.

The Supreme Court relied on three prior decisions to reach its conclusion. In *Addington v. Texas* (441 U.S. 418) the court had held that civil commitment required a showing by clear and convincing evidence that a person was both mentally ill and required hospitalization for the protection of self or others. *Jones v. U.S.* (463 U.S. 354) had allowed the state to commit a defendant found NGRI without meeting the *Addington* burden, because the court had held that the NGRI verdict established the facts that the defendant was mentally ill and had committed a criminal act. The *Jones* court had inferred that the defendant, at the time of the verdict, must be mentally ill and dangerous. *Jones* still indicated, however, that the defendant should be released when he had either recovered his sanity or was no longer dangerous. As a result, the court reasoned that Foucha could not be kept in the hospital without a determination that he was both currently mentally ill and dangerous. The court also cited *Vitek v. Jones* (445 U.S. 480, 1980) which established a convicted felon's liberty interest in not being sent to a mental hospital without showing that he was mentally ill. The court concluded that an NGRI acquittee would be entitled to the same consideration as a convicted felon.

The court went on to point out that in some narrow circumstances a person who was a danger to the community might be detained for a limited period of time, as defined by *U.S. v. Salerno*, 481 U.S. 739. *Salerno*, however, involved pretrial detention and applied only to cases of serious crimes where there was an overwhelming government interest in confining the defendant. Furthermore, *Salerno* placed strict limits on the duration of confinement; if acquitted, the defendant would immediately go free.

The court also emphasized the fact that, in Foucha's case, no doctor had actually testified positively that he was dangerous. The state had placed the burden on him to prove he was not dangerous, rather than assuming the burden to prove by clear and convincing evidence that he was. The court concluded that the state's argument—that Foucha was an antisocial personality who could commit more crimes—would allow the state to detain any NGRI acquittee with such a personality disorder or indeed any convicted felon who had already served his maximum sentence.

Justice O'Connor wrote a concurring opinion in order to point out that the majority was only addressing the Louisiana statute and was not passing judgment on more narrowly formulated laws. It might therefore be acceptable to confine an NGRI acquittee if the nature and duration of the confinement had a medical justification and were tailored to a specific public safety concern. Justice Kennedy dissented, apparently out of concern that Foucha's initial insanity might have been malingered. He argued that the state had an interest in incapacitative incarceration, even though it was not considered to be punishment. Justice Thomas also wrote a dissent, which maintained that there was a legitimate distinction to be drawn between NGRI and civil committees, which justified different procedures for their commitment. The NGRI acquittee has been found to have committed a criminal act; because psychiatry is not an exact science, the decision to release the acquittee should not hinge on whether the person is thought to have regained his sanity. Thomas maintained that it was thus a reasonable legislative judgment to say that the NGRI acquittee should not be released as long as he remains dangerous.

Clark v. Arizona, 548 U.S. 735 (2006)

In *Clark v. Arizona,* the U.S. Supreme Court held that Arizona's test for insanity, which eliminated the cognitive component of the *M'Naghten* standard so that it hinged on a defendant's ability to tell whether an act charged as a crime was right or wrong, did not violate due process. The court also held that Arizona law excluding evidence of mental illness and incapacity due to mental illness on the issue of *mens rea* did not violate due process.

On June 21, 2006, a police officer on patrol responded to complaints of a pick-up driving the streets of a Flagstaff neighborhood blasting loud music. The officer, in a marked car with sirens and lights engaged, pulled over the truck, driven by the defendant Eric Clark. The officer exited his car, approached Clark, informing him to remain in his vehicle, after which Clark shot the officer, killing him. Clark was subsequently apprehended and charged with first-degree murder.

At trial, Clark did not dispute the events of the shooting, but he made two arguments: first, he was insane at that time of the shooting, which Arizona defined as "at the time of the commission of the criminal act [he] was afflicted with a mental disease or defect of such severity that [he] did not know the criminal act was wrong." Clark also disputed that he possessed *mens rea* required for a conviction of first-degree murder because, on account of his mental illness, he believed he was shooting an alien, not a law enforcement officer. The judge overseeing the case found Clark guilty of first-degree murder, determining, consistent with state law as articulated in *Mott v. Arizona*, that evidence regarding the effects of mental illness on capacity should be restricted to a determination of sanity only, and could not be used by a defendant to rebut *mens rea* as an element of the crime the prosecution need prove beyond a reasonable doubt. Clark appealed, and the U.S. Supreme Court granted *certiorari*, after the Arizona Court of Appeals confirmed the conviction and the Supreme Court of Arizona declined to review further Clark's due process claims.

With regard to Arizona's elimination of the cognitive component of the *M'Naghten* insanity test via legislative amendment in 1993, the majority first qualified the burden of Clark's claim, that this amendment "offends a principle of justice so rooted in the traditions and conscience of our people as to be ranked as fundamental," for the U.S. Supreme court to overrule how a state defines its criminal laws and procedure. The court found that it did not, citing that some states do not offer an insanity defense, and in those that do, the use of the full *M'Naghten* test is far from universal. Moreover, the court argued, on the basis of logic, that "cognitive incapacity is itself enough to demonstrate moral incapacity." In other words, the two incapacities are redundant, not additive—if you do not know that nature and quality of the act, then you cannot know its wrongfulness.

With regard to Clark's *mens rea* objection, the majority upheld the decision in *Mott v. State* as constitutional; in this case, the Arizona state court held that testimony of a professional psychologist or psychiatrist about a defendant's mental incapacity owing to mental disease or defect was admissible, but may be considered only for its bearing on an insanity defense, and that such evidence could not be considered on the element of *mens rea*. To do so, the court distinguished the presumption of innocence from the presumption of sanity, and the relevant burdens to overcome them. The prosecution bears the burden to overcome the presumption of innocence, and must prove their case beyond a reasonable doubt. However, the defendant bears the burden to overcome the presumption of sanity, and must do so with proof, in Arizona, by clear and convincing evidence, but the court emphasized that legislatures are given wide latitude to define "the strength of the presumption of sanity and the kind of evidence and degree or persuasiveness to overcome it."

Furthermore, the court argued, channelling expert (as opposed to lay) testimony on a defendant's capacities to the question of sanity only (as opposed to allowing such experts to cast doubt on *mens rea*) is not fundamentally unfair: "What counts for due process, however, is simply that a State wishes to avoid a second avenue for exploring capacity, less stringent for a defendant, has a good reason for confining the consideration of evidence of mental disease and incapacity to the insanity defense." Thus, the majority concluded that

states are allowed under certain circumstances to limit what and how certain evidence is admitted if there is a compelling state interested to justify the restriction, and the state's interest in defining criminal responsibility with regard to lack of capacity related to mental illness is such a compelling interest. What's more, the majority cited concerns that "an expert's judgment in giving capacity evidence will come with an apparent authority that psychologist and psychiatrists do not claim to have. We think that this risk, like the difficulty in assessing the significance of mental-disease evidence, supports the State's decision to channel expert testimony to consideration on the insanity defense, on which the party seeking the benefit of this evidence has the burden of persuasion."

The dissent reframed the question at hand: "The issue is not, as the Court insists, whether Clark's mental illness acts as 'an excuse from customary criminal responsibility,' … but whether his mental illness, as a factual matter, made him unaware that he was shooting a police officer." In this vein, the dissent argued that testimony from mental health experts on Clarke's diagnosis was relevant to answering this question, and disagreed with the majority's characterization of such testimony as unreliable, especially in the context of a first-degree murder trial: "While the State contends that testimony regarding mental illness may be too incredible or speculative for the jury to consider, this does not explain why the exclusion applies in all cases to all evidence of mental illness." The dissent, in closing, took another of the majority's argument to the absurd: "In sum, the rule forces the jury to decide guilt in a fictional world with undefined and unexplained behaviors but without mental illness. This rule has no rational justification and imposes a significant burden upon a straightforward defense: He did not commit the crime with which he was charged."

SUBSTANCE ABUSE AND CRIME

Robinson v. California, 370 U.S. 660 (1962)

Robinson v. California represents the Supreme Court's comment on a state's use of criminal procedures as a way of dealing with the problem of drug addiction. The California Health and Safety Code made it a misdemeanor for a person to "be addicted to the use of narcotics." A jury in Los Angeles convicted Robinson under this statute, basing its decision on a police officer's testimony that he had found "track" marks on Robinson's arms. The prosecution made no claim that the defendant engaged in any other illegal conduct at the time. A California appeals court upheld the conviction.

When the case reached the Supreme Court, the issue was whether the California statute was unconstitutional under the Eighth and Fourteenth Amendments. A majority opinion, written by Justice Stewart, held that it was unconstitutional. Stewart pointed out that the California statute allowed the state to find a person guilty of an offense continuously, regardless of whether he had ever actually used narcotics in the state. He relied heavily on the idea that addiction is an illness, analogous to mental illness or leprosy, arguing that it would universally be considered cruel to punish people for such illnesses. Justice Douglas wrote a concurring opinion, emphasizing the severity of the illness involved and the barbarity of punishing someone for it.

Justices Clark and White dissented separately. Clark accepted the use of a criminal penalty as part of a program of addiction control, where civil and criminal procedures were both "inherently" aimed at treatment. According to his analysis, California's criminal provisions applied to addicts who still had control over their drug use, while civil commitment was available to deal with those who had lost self-control. White, on the other hand, rejected the idea that Robinson had not engaged in illegal conduct, because addiction logically implies that a person must have committed the act of using drugs. To White, therefore, the conviction did not depend on Robinson's status as an addict.

Powell v. Texas, 392 U.S. 514 (1968)

Powell v. Texas, coming 6 years after *Robinson v. California* (370 U.S. 660, 1962), addressed a closely related issue: whether it was cruel and unusual punishment to convict an alcoholic for public drunkenness.

Powell had been convicted in the Corporation Court of Austin, Texas, for being intoxicated in public. He was retried on appeal in county court, where a medical expert testified that Powell was in fact a chronic alcoholic and that, while his taking his first drink was voluntary, Powell had also acted under a compulsion that was "not completely overpowering" but a "very strong influence." His counsel argued that it was a violation of the Eighth Amendment to arrest him for a disease, chronic alcoholism, since he did not appear in public of his own volition when he was drunk. The court rejected this argument and reinstated Powell's conviction and a fine of $50.

Powell appealed his case directly to the Supreme Court, which affirmed his conviction. Justice Marshall, writing for the majority, maintained that there was in fact no consensus among the medical profession about the "disease concept" of alcoholism. Distinguishing the case from *Robinson v. California*, Marshall reasoned that Powell was convicted not for the status of being an alcoholic but rather for the act of being in public while intoxicated. Marshall pointed out the potentially radical effect that accepting Powell's argument could have in criminal law: a psychiatrist could testify that an assaultive person suffered from an "aggressive neurosis" that he could control while sober but not while drunk; under Powell's claim, such a person could no longer be held accountable because he acted under an "exceedingly strong influence." The court, therefore, concluded that, given the present state of medical knowledge, an alcoholic could not be construed to suffer from an "irresistible compulsion" to drink and get drunk in public in a way that the person was "utterly unable to control."

Justice Fortas, in a dissent joined by three of his colleagues, pointed out the fact that Powell had been convicted one hundred times since 1949 for public drunkenness—evidence of the compulsive nature of his behavior. Arguing

that such a "condition" is indeed a "status," the dissent considered that the sole question in the case, as in *Robinson*, was whether a criminal penalty could be imposed on a person for a disease.

Montana v. Egelhoff, 116 S.Ct. 2013 (1996)

After a night of heavy drinking, James Egelhoff was accused of shooting and killing two acquaintances. At the time of his arrest, his blood alcohol level was measured at 0.36%. Egelhoff was convicted at trial after offering the defense that his extreme intoxication had rendered him mentally incapable of committing murder. Montana's criminal code provided that voluntary intoxication could not be considered in determining the mental state of the defendant, and the trial court had instructed the jury accordingly. On appeal, the Montana Supreme Court overturned Egelhoff's conviction. The court ruled that the Due Process clause of the Fourteenth Amendment gave the defendant the right to present "all relevant evidence"; it held that intoxication was relevant to the issue of whether the defendant acted "knowingly and purposefully" in causing the victim's deaths.

The U.S. Supreme Court then agreed to review the case. The issue before the court was whether Montana's criminal code violated the Due Process clause of the Fourteenth Amendment in its provision that voluntary intoxication cannot be considered in determining the mental state of the defendant, which is an element of the charge of murder. The Supreme Court reversed the decision of the Montana Supreme Court. A divided court held that due process *does not* guarantee to the defendant the right to present all relevant evidence. (A plurality of four justices depended on the concurrence of Justice Ginsburg for the decision.) The court held that this right exists only where restrictions on the presentation of evidence would offend a principle of justice "so rooted in the traditions and conscience of our people as to be ranked as fundamental."

The court relied on historical practice as a guide, noting to begin with that there is a well-established rule in common law that voluntary intoxication provides no excuse for a crime. The court pointed out, however, that there are any number of evidentiary rules (e.g., the hearsay exclusion) that exclude relevant evidence, where the probative value of the evidence is outweighed by the risk of unfair prejudice. The court conceded that, by the end of the nineteenth century most American jurisdictions allowed the consideration of intoxication in determining whether a defendant was capable of forming the specific intent to commit a particular crime. The court was not persuaded, however, that this fact demonstrated a "deeply rooted" and "fundamental" right. The court pointed out that one-fifth of the states never adopted such a rule; although the rule had gained general acceptance, it was still too recent and not "sufficiently uniform" to be considered fundamental.

Justice Ginsburg's concurrence argued that the Montana statute represented a legislative judgment about the circumstances when a person can be held criminally responsible and therefore was a measure that redefined *mens rea*. The defendant in this case committed a killing under circumstances that would establish actual purposefulness but for his voluntary intoxication. She concluded that a legislative redefinition of *mens rea* does not offend any fundamental principle of justice.

In dissent, Justice O'Connor argued exactly the opposite. She maintained that the Montana statute was excluding an "essential element" of the crime in excluding evidence of intoxication. She argued that it was inconsistent to require proof of "knowing" behavior and "purpose," and yet to exclude evidence of intoxication. Justices Souter and Breyer also filed dissenting opinions that made the additional argument (against Justice Ginsburg) that the Montana Supreme Court had never understood the Montana statute to be a redefinition of the mental element of homicide.

SEX OFFENDERS

Specht v. Patterson, 386 U.S. 605 (1967)

The State of Colorado convicted Specht of a sex offense and then invoked its separate Sex Offenders Act in order to sentence him to an indefinite term of detention (which could be up to life). Under this act, a trial court could find that a person convicted of a sex crime represented a "threat of bodily harm" to the public or was a mentally ill habitual offender. The procedure for making this determination required only a psychiatric examination and written report that would make a recommendation as to whether the defendant was treatable as a sex offender. On appeal, the Colorado Supreme Court approved the procedure, and a federal appeals court rejected Specht's *habeas corpus* petition.

On appeal to the U.S. Supreme Court, the issue was whether Colorado could constitutionally convict the defendant under one statute and then sentence him under another, without a new hearing. The court held that Colorado's procedure was unconstitutional under the Fourteenth Amendment. The court reasoned that the Sex Offenders Act did not make a specific crime the basis of the sentence; it only made the conviction of that crime the basis for a new, separate proceeding to determine if the convicted fit the criteria for treatment as a sex offender. The latter would therefore constitute a new finding of fact and was equivalent to a criminal proceeding on a new charge. The court held that in this situation the Fourteenth Amendment required full rights to due process, including the right to counsel, to a hearing, to confront witnesses, to cross-examination, and to offer evidence in one's own defense.

Allen v. Illinois, 478 U.S. 364 (1986)

Terry Allen was arrested and charged with a sex offense, and the State of Illinois filed a petition under its Sexually Dangerous Persons Act to have him declared a sexually dangerous person. The court then ordered an examination of Allen by two psychiatrists. When the two psychiatrists

testified in court, Allen objected that they had obtained information from him in violation of his Fifth Amendment privilege against self-incrimination. The psychiatrists were allowed to testify that Allen was mentally ill and that he had a propensity to commit further sexual crimes. On appeal the Appellate Court of Illinois reversed the lower court's decision, but the Supreme Court of Illinois reinstated it, holding that the court proceeding had been "essentially civil in nature," with the aim of providing treatment for Allen, not punishment. The court observed that the state's interests in treating him and in protecting the public would be stymied by allowing him to refuse to be interviewed by psychiatrists. Because the Fifth Amendment protects a person from being compelled to testify against himself in a criminal case, the crucial issue in *Allen* was whether the proceedings were criminal or civil.

The U.S. Supreme Court held that the proceedings under the Illinois Sexually Dangerous Persons Act were indeed civil. The court noted first that the statute expressly states that it is a civil proceeding. It then noted that the act requires the state to prove that the person has a mental disorder and is dangerous. The act also requires the state to provide treatment for the sexually dangerous person in a psychiatric facility. Unlike a convicted prisoner, the person might apply for release at any time and attempt to prove that he is no longer dangerous. The court concluded that the fact that a proceeding has some due process safeguards or the fact that it can result in a loss of liberty does not mean that the proceeding is criminal in nature.

Four justices dissented from the decision, concluding that the substance of the Illinois statute made it unlike the usual civil commitment: the proceeding only begins after the person is charged with a crime; the state has to prove that a sexual offense was committed; the act would authorize longer incarceration than a criminal conviction; and the act defines the sexually dangerous person as having "criminal propensities." Although the state argued that allowing the person a right to remain silent would make diagnosis impossible, the dissenters pointed out that Illinois commitment law actually protects a patient's right to silence. Thus, both the criminal defendant and the subject of civil commitment in Illinois have a right to remain silent. Only the sexually dangerous person can be required to give information that can be used to incarcerate him.

In re Young and Cunningham, 857 P.2d 989 (1993)

Andre Young and Vance Cunningham were committed as sexually violent predators by the State of Washington under its Community Protection Act. Their cases were joined in a challenge to the constitutionality of their commitments. Their appeal to the Supreme Court of Washington involved multiple issues and arguments, and they were each successful to some extent, even though the court upheld the constitutionality of the act itself. Among the issues raised by Young and Cunningham were the following: that the act was in effect a criminal law that violated the double jeopardy and *ex post facto* provisions of the Constitution; that the act amounted to preventative detention of dangerous individuals and that a finding of dangerousness required a demonstration of a recent, overt act of violence; that the act should take into account the principle of the least restrictive alternative; and that procedurally an involuntary commitment requires a probable cause hearing and a unanimous jury verdict, as well as according the subject the Fifth Amendment right to remain silent.

The court recognized that the purposes of the act were both to provide treatment for sex offenders and to protect the community by incapacitating persons who had an intractable condition and were particularly dangerous. The court accepted the need for a civil commitment scheme that was "specially tailored" to this population. The act defined sexually violent predators as individuals with antisocial personalities who were not amenable to ordinary psychiatric treatment but who were likely to engage in sexually violent behavior. The act explicitly recognized that their prognosis for cure was poor. Young and Cunningham had both been found to fit this definition. Young had six convictions for raping adult women over a period of 31 years. He had refused to participate in a psychiatric examination, even after being ordered to do so by the trial court. He had, however, been given a diagnosis of personality disorder with paranoid and antisocial traits as well as a diagnosis of paraphilia. Cunningham had three convictions for raping adult women and was also given a diagnosis of paraphilia. In his case the trial jury had voted 11–1 to find that he was a sexually violent predator. The Washington Supreme Court ruled on a number of issues:

1. *Double jeopardy and* ex post facto *prohibitions*: The court held that the act was a civil statute, so that these constitutional provisions did not apply. Relying on *Allen v. Illinois,* 478 U.S. 364, the court found that the act was not so punitive in nature that it warranted designation as a criminal law. The court pointed out that incapacitation has always been a recognized goal of civil commitment and that designation as a sexually violent predator was based on findings of mental abnormality, not culpability.
2. *Due process*: Again citing *Allen v. Illinois*, the court noted that mental illness and dangerousness are required as criteria for civil commitment, but ruled that the terms "mental illness" and "mental disorder" were in fact used interchangeably. Some experts had testified that the concept of "mental abnormality" is virtually the same as the concept of "mental disorder" as used in the APA's *Diagnostic and Statistical Manual of Mental Disorders.* Both Young and Cunningham had indeed been given diagnoses of Paraphilia.
3. *Preventative detention*: In *Foucha v. Louisiana*, 112 S. Ct. 1780, the committed individual had a diagnosis of antisocial personality. He was found by the Supreme Court not to be committable without a mental illness. Making

a fine distinction, the Washington Supreme Court noted that antisocial personality is not a mental disorder according to the APA. (It was a V-code in the *Diagnostic and Statistical Manual of Mental Disorders*, 3rd edition, revised [*DSM-III-R*].) Young and Cunningham by contrast had mental disorders. Further distinguishing the case from *Foucha* was the fact that Washington placed the burden of proof on the state to show beyond a reasonable doubt that a person was a sexually violent predator.

4. *Overt act requirement*: Although civil commitment law in Washington did require a recent overt act to prove dangerousness, the court ruled that for an incarcerated inmate such a requirement would be impossible for the state to meet. For a person released in the community, however, the court held that the recent overt act criteria did apply. Because Cunningham had been released four-and-a-half months prior to his commitment and had apparently committed no new acts of violence, the court held that the state had not demonstrated his dangerousness. The court therefore reversed Cunningham's commitment.
5. *Procedural issues*: Noting that Equal Protection does not require that all persons be dealt with equally, the court reasoned that the past behavior of convicted sex offenders differs significantly from the behavior of the mentally ill and therefore justifies different treatment. The court did rule, however, that a 45-day waiting period for a hearing was an unwarranted infringement on the liberty interests of the offender, and it required the state to hold a hearing within 72 hours of seeking commitment.
6. *Least restrictive alternative*: While dangerousness justifies the use of secure confinement, the court noted that the state's mental health statutes require the state to consider the least restrictive alternative. Because not all sex offenders are equally dangerous, equal protection requires the state at least to consider less restrictive alternatives before confining sex offenders.
7. *Unanimous verdict*: The standard of "beyond a reasonable doubt" usually requires a unanimous jury verdict. In Cunningham's case, one juror thought that the state had failed to meet its burden of proof. As a result, the court held that this verdict was insufficient to adjudicate Cunningham a sexually violent predator. The verdict in Young's case, however, was affirmed.
8. *The Fifth Amendment*: The court reiterated that the act was not a criminal statute, so that the right to remain silent did not apply.
9. *Expert testimony*: Young and Cunningham challenged the state's experts, claiming that they were operating on theories about prediction of behavior that were not generally accepted by the scientific community. The court rejected this argument, pointing out that to accept it would vitiate all civil commitment laws. The prediction of dangerousness does not violate due process, in spite of the uncertainty of psychiatric diagnosis.

In a dissenting opinion, Justice Johnson characterized the Community Protection Act as nothing but a scheme for the indefinite confinement of people who were not mentally ill and therefore as unconstitutional under the standard of *Foucha*. He pointed to the circular logic involved in using past sexual conduct as the basis for finding an "abnormality," which is then used to establish the likelihood of future dangerous sexual conduct.

Kansas v. Hendricks, 117 S.Ct. 2072 (1997)

In 1994 Kansas passed a Sexually Violent Predator Act, providing civil commitment for persons who were found to have a mental abnormality or personality disorder that predisposed them to commit violent sexual offenses. The state used this statute to commit Leroy Hendricks, a man with a long history of sexual abuse of children. Hendricks was approaching the end of a prison sentence for a sex crime and had been scheduled for release when he was committed. Hendricks challenged his commitment, claiming that it violated the Constitution's prohibition of double jeopardy and *ex post facto* laws. When the Kansas Supreme Court heard the case, it overturned Hendrick's commitment, holding that the concept of "mental abnormality" did not meet standard criteria for civil commitment, because due process required the finding that the person at issue suffered from a mental illness.

The Kansas Sexually Violent Predator Act stated that there is a small but very dangerous group of sex offenders who do not have a mental disease or defect that would make them eligible for ordinary involuntary commitment. These individuals instead have an antisocial personality disorder that is not amenable to standard psychiatric treatment. The act defined this type of mental abnormality as "a congenital or acquired condition affecting the emotional or volitional capacity, which predisposes the person to commit sexually violent offenses." To be subject to commitment under the act, a person had to be convicted of a sexual offense, charged with a sexual offense, or found NGRI regarding a sexual offense. Once determined by a court to be a Sexually Violent Predator, the person would be detained until his or her mental abnormality was improved to the extent that the person was "safe" to be in the community. Hendricks was found to qualify for commitment after he testified that the only sure way to keep him from abusing children would be for him to die.

The U.S. Supreme Court overturned the ruling of the Kansas Supreme Court, holding that the Sexually Violent Predator Act was constitutional. The court noted that Hendricks' double jeopardy and *ex post facto* arguments hinged on the contention that the act subjected him to additional punishment beyond his original sentence upon conviction at trial. Following *Allen v. Illinois* (478 U.S. 364) the court ruled that the act was genuinely a civil commitment and not a criminal statute. The court pointed out that the act required both a finding of dangerousness and of mental abnormality. It held that pedophilia, which was Hendrick's

diagnosis, was indeed a mental disorder, but that furthermore the term "mental illness" has no unique legal significance. The court never required a state to use any particular terminology in civil commitment statutes. The court also concluded that the act was not so punitive as to render it effectively a criminal statute. If a person were found to be safe to be released, he could be released immediately. The court went on to find that the lack of effective treatment for sex offenders did not make the law unconstitutional. The court pointed out that it has long been recognized as a legitimate purpose for civil commitment laws to segregate from the general public certain people who represent a danger and are unable to control themselves. (The court cited the example of people with highly contagious diseases.)

In a dissent, Justice Breyer disagreed with the basic contention that the Sexually Violent Predator Act was not punitive. He agreed that the concept of "mental abnormality" could satisfy due process requirements for commitment. He argued, however, that the fact that Kansas did not provide any treatment for sex offenders in prison and only began to offer treatment after their sentences were served provided a telling indication that the act was primarily a mechanism for further incarceration. Otherwise, he reasoned, why would the state not bother to begin treating the sexually violent inmate while in prison?

McKune v. Lile, 536 U.S. 24 (2002)

In *McKune v. Lile,* the U.S. Supreme Court considered whether a Kansas law that leveraged felons convicted of sexual offenses to confess all prior deviant sexual behavior violated their Fifth Amendment right against self-incrimination.

Mr. Lile had been convicted in 1982 of rape; a few years before the completion of his criminal sentence, he was eligible to enroll in Kansas' Sexual Abuse Treatment Program (SATP), which consisted of 18 months of individual and group therapy to reduce an inmate's risk of sexual reoffending on release. To participate in the program, inmates had to complete an "Admission of Responsibility" form, via which they were expected to detail all prior sexual offenses and acknowledge their guilt. The information the inmates provided was not privileged, and per the statute, could be used against them in future prosecutions. Mr. Lile declined to complete the form, invoking his Constitutional guarantee against self-incrimination. As a result, per the SATP statute, he lost certain privileges for the remainder of his sentence. Specifically, he was relocated from a medium to a maximum security facility, his wage for prison labor was reduced, the amount of money he could spend on canteen items per month was lowered, and he lost access to a personal television. Mr. Lile's claim was initially upheld in federal district court and the Court of Appeals, and Kansas petitioned the U.S. Supreme Court for *certiorari*. The court, in a 5–4 decision, reversed and remanded.

The majority argued that while SATP required an inmate to confess his prior crimes, this requirement did not constitute compulsion, and, therefore, did not violate the Fifth Amendment. The privileges that inmates lost for refusing to participate in SATP, the majority argued, were not "atypical and significant hardships." As the majority stated, not all persuasion is compulsion: "It is well settled that the government need not make the exercise of the Fifth Amendment privilege cost free … The Court likewise has held that plea bargaining does not violate the Fifth Amendment, even though criminal defendants may feel considerable pressure to admit guilt in order to obtain more lenient treatment." The majority also argued that goals of SATP represented a vital state interest in terms of rehabilitation of offenders and ensuring public safety, and this end justified its means, in terms of requiring inmates to confess.

The dissent argued that the loss of privileges for refusal to participate in SATP were identical to those imposed for violation of prison rules such as theft, drug abuse, assault, and possession of dangerous contraband, and, therefore, concluded that refusal resulted in punishment, not a mere loss of privileges. The dissent also distinguished between the certainty of the consequences of refusing to participate in SATP, compared to the probabilistic risk-versus-benefit calculation a defendant must consider when invoking his or her Fifth Amendment right to remain silent. With regard to balancing an individual's interest against self-incrimination versus the state interest in law enforcement, the dissent concluded, "'The State's interests in law enforcement and rehabilitation are present in every criminal case. If those interests were sufficient to justify impinging on prisoners' Fifth Amendment right, inmates would soon have no privilege left to invoke."

Kansas v. Crane, 534 U.S. 407 (2002)

In *Kansas v. Crane,* the U.S. Supreme Court considered whether or not, and to what degree, the Kansas statute authorizing civil commitment of sexually violent predators (SVPs) required a finding of the individual's inability to control his or her dangerous sexual conduct.

Over the course of a single day, in 1993, Mr. Crane committed two acts of sexual battery—exposing his genitals to a tanning salon attendant, and later, entering a video store, exposing his genitals to the clerk and threatening to rape her unless she performed oral sex. He subsequently pleaded guilty, and the state sought to have him committed as a sexually violent predator. The statute in Kansas at the time allowed civil commitment of an individual "convicted of any of several enumerated sexual offenses, if it is proven beyond a reasonable doubt that he suffers from a 'mental abnormality'—a disorder affecting his 'emotional or volitional capacity which predisposes the person to commit sexually violent offenses'—or a 'personality disorder,' either of 'which makes the person likely to engage in repeat acts of sexual violence.'" Crane was committed on this basis at trial, and appealed to the state supreme court, which overturned the decision, arguing that the state SVP statute, deemed Constitutional in the prior 1997 U.S. Supreme

Court decision *Kansas v. Hendricks*, required that to ensure due process, the state was required to prove beyond a reasonable doubt that the individual lacked complete control over his dangerous sexual behavior, and had failed to do so in Mr. Crane's case. The state requested *certiorari* from the U.S. Supreme Court.

The court, relying on its prior decision, clarified that the state SVP statute did require an inquiry into an individual's inability to control his or her dangerous sexual behavior; however, the inability must not be total to justify civil commitment. The court argued that such a determination was necessary to distinguish those offenders with a mental disorder—who are subject to commitment—from those recidivists who do have control of their behavior, and are more appropriately managed via a criminal rather than therapeutic model. The court conceded that determinations of an individual's inability to control behavior would lack mathematical precision, and that in the area of mental illness, liberty interests are not always best enforced through "precise bright-line rules."

The dissent argued that requiring the fact finder to inquire about an individual's volitional capacity beyond establishing that an SVP suffers from a mental disorder that renders him likely to reoffend would be redundant, and, therefore, not required to ensure due process. In other words, by definition, a person suffering a mental disorder that predisposes him or her to deviant sexual behavior has diminished volutional capacity, and an independent inquiry is not needed. Given this impression, the dissent recommended not just remanding the case back to the state for reconsideration but urged reversal, as the facts of the case establish that Mr. Crane suffered from exhibitionism, a condition that predisposed him to commit sexually violent offenses, and, therefore, he could be committed civilly under Kansas state law.

THE DEATH PENALTY

Barefoot v. Estelle, 463 U.S. 880 (1982)

Barefoot was convicted of the murder of a police officer in Texas in 1978. Under the Texas death penalty statute (approved by the Supreme Court in *Jurek v. Texas* [428 U.S. 262, 1975]), a separate sentencing proceeding addressed two "special questions" (which had to be answered in the affirmative and beyond a reasonable doubt in order to sentence the defendant to death): first, whether Barefoot's conduct was deliberate in causing the death, and second, whether there was a probability that he would commit further violent criminal acts.

The prosecutor called as witnesses two psychiatrists, who had not examined Barefoot, and asked them hypothetical questions. Their answers suggested that Barefoot would commit more violent offenses—one of the psychiatrists testified that he was "100% sure" that a person with the given characteristics would be violent in the future. The jury decided against Barefoot and sentenced him to death.

The legal issues before the Supreme Court had to do with whether the lower federal appeals courts had erred in rejecting a *habeas corpus* petition and a stay of execution. The psychiatric–legal issues, however, were whether a psychiatrist could predict future acts of violence and whether a psychiatrist should be allowed to testify from hypotheticals without examining the defendant.

The Supreme Court ruled against Barefoot on both questions, that is, that the court would not bar psychiatrists from predicting future violence, nor would it bar hypothetical testimony without examination.

In his majority opinion, Justice White argued that to prohibit psychiatrists from testifying about dangerousness amounted to trying to "disinvent the wheel." Reasoning that it is "not impossible" for a layperson to assess the probability of future violence in a sensible way, White concluded that it would make no sense to prevent psychiatrists from doing the same. He quoted the *Jurek* case to the effect that the criminal justice system routinely requires such predictions to be made, for example, by judges and parole officers. He pointed out that the view of the American Psychiatric Association, which in its amicus brief cast doubt on psychiatrists' ability to predict danger, was not a "constitutional rule," and furthermore, that the defense could present its own witnesses to controvert inaccurate psychiatric testimony. White implied that it should be easy to impeach the testimony of a psychiatrist who claimed 100% certainty.

As to the second question, White pointed out that hypothetical questions are well established and commonly admitted. He reiterated the basic guideline that expert testimony should be admitted whenever it is "helpful" to the fact finder.

Justice Marshall dissented, arguing that because the death penalty is qualitatively different from other penalties, there is a corresponding need for a higher degree of reliability in death penalty decisions. Justice Blackmun also wrote a dissent, with which Justices Marshall and Brennan joined: Blackmun argued that "specious testimony" by a psychiatrist should not be allowed to color the decision of an "impressionable" jury. He noted that *Frye v. United States* (293 F. 1013, 1923) had held that unreliable scientific evidence was prejudicial because it could mislead the jury by the "aura" of scientific infallibility. He quoted the same APA amicus brief that the majority rejected, to the effect that psychiatrists cannot predict future violence correctly, and added that the state had not in fact demonstrated a pattern of repetitive assault or violent crime on Barefoot's part. He also invoked the APA opinion that it is unethical for a psychiatrist to offer a professional opinion about a person without conducting an examination. Blackmun characterized the majority opinion as accepting the admissibility of expert testimony that is "so unreliable and unprofessional that it violates the canons of medical ethics."

Payne v. Tennessee, 111 S.Ct. 2597 (1991)

Payne v. Tennessee revised an important principle in capital sentencing jurisprudence by allowing the jury in a capital

case to hear evidence about the impact of a crime on the family of the victim.

Pervis Payne was convicted of the brutal murder of a 28-year-old woman and one of her small children. (One of the victims was found to have suffered 84 knife wounds in the attack.) In spite of the apparently overwhelming evidence against him, Payne had chosen to testify in his trial, claiming that another man had committed the murders immediately before he arrived at the scene. Payne was found guilty by the jury. In the sentencing phase of his trial, four character witnesses testified on his behalf, including a psychologist who reported that he had a low IQ and was "mentally handicapped." The prosecution presented the mother and grandmother of the victims, who testified about the severe impact of the crime on the small boy who survived the attack and who knew that his mother and sister had been killed. The jury then sentenced Payne to death.

The Supreme Court stated that it granted *certiorari* in this case in order to allow a reconsideration of its prior position that the Eighth Amendment prohibited a capital sentencing jury from hearing victim impact evidence related to the personal characteristic of the victim and the emotional impact of the crime on the victim's relatives. The court's previous approach (established in *Booth v. Maryland,* 482 U.S. 496 and *South Carolina v. Gathers,* 490 U.S. 805) was that a jury should decide a capital sentence based only on the character of the defendant and the circumstances of the crime; the characteristics of the victim were not considered relevant to the defendant's blameworthiness. In departing from this rule, the court noted that when judges have had discretion in sentencing, they have always been allowed to consider the degree of harm caused by the crime as an important factor. The court therefore reasoned that victim impact evidence is designed to inform the jury about the "uniqueness" of the victim as an individual and therefore about the specific harm caused by the murder. The harm caused is directly related to the defendant's moral culpability. The court also noted that the state has a legitimate interest in rebutting the mitigating evidence offered by the defense. The court concluded that Payne's sentencing did not violate the Eighth Amendment.

A dissenting opinion by Justices Marshall and Blackmun argued that this decision was based on no change in the law or the facts of the cases cited, but merely resulted from a change in the makeup of the Supreme Court. The dissent reiterated the idea that capital sentencing is supposed to involve an individualized decision about the defendant's responsibility for the crime and his moral guilt, in order to avoid arbitrary or capricious decision making. The dissenters argued that victim impact evidence is an invitation to prejudice, directing the jury to look at the character and status of the victim rather than simply at the character of the defendant. An additional dissent by Justices Stevens and Blackmun maintained that victim impact evidence serves no purpose except to appeal to the emotions of the jury, and that such evidence has never been admissible.

State v. Perry, 610 So.2d 746 (1992)

In *State v. Perry* the Supreme Court of Louisiana addressed the question whether the state could give anti-psychotic medication involuntarily to an incompetent death row inmate in order to render him competent to be executed. Michael Perry had been convicted of murdering his mother, father, nephew, and two cousins. He had a long history of mental illness, with a diagnosis of schizophrenia. Prior to his trial, Perry was found to be incompetent and was treated with anti-psychotic medications in a state hospital over a period of 18 months. He was then found to be competent and was allowed to withdraw his insanity plea and plead not guilty. He was convicted at trial and sentenced to death. His sentence was upheld by the Louisiana Supreme Court, but a new evaluation of his competence to be executed was ordered. Psychiatric experts then reported that Perry suffered from an incurable disorder, but that his psychotic symptoms could be diminished by giving him medication. The trial court found that he was competent to be executed while being maintained on anti-psychotic drugs and ordered that the state should continue to medicate Perry, by force if necessary. Perry appealed to the U.S. Supreme Court, which remanded the case for reconsideration in light of its decision in *Washington v. Harper,* 494 U.S. 210 (1990). The trial court held that *Washington v. Harper* was inapplicable, and renewed its order for forced medication. The Louisiana Supreme Court reversed this ruling, holding that it violated Perry's right to privacy and amounted to cruel and unusual punishment under the constitution of the state of Louisiana.

The court found that the Louisiana constitution contained a higher level of protection against cruel and unusual punishment than that provided by the Eighth Amendment to the U.S. Constitution. Even though he was a convicted felon, Perry still maintained some liberty interests, specifically with regard to the "invasion" of his body and mind by powerful drugs. The court concluded that involuntary medication, administered for the sole purpose of making him competent to be executed, was an unjustified invasion of his privacy and added a special and degrading indignity to his punishment that made it "cruel, excessive, and unusual." The court accepted as a matter of fact that Perry would only be competent to be executed as long as he was medicated. The forcible medication therefore was ordered solely in order to bring him to execution and not for the purposes that might be sanctioned under the standards of *Harper* (where the Supreme Court ruled that a prison inmate might be medicated involuntarily if the medication was medically indicated for his own good and where his safety or the safety of others around him was at issue). The court backed up its conclusions by quoting from the Hippocratic Oath, wherein physicians swear only to act in the best medical interests of patients. The court reasoned that Perry's forced medication was not meant to do him any good, in fact did not even constitute medical treatment, and therefore required a physician to act unethically.

Two dissenting justices marshalled a number of objections to the majority decision. Justice Marcus argued that the standard for competency to be executed required only that Perry be aware of his punishment and of the reason that it was being administered. Marcus concluded that the trial judge did not abuse his discretion in finding Perry competent under this minimal standard. Justice Marcus also argued that the state did have a legitimate penological interest in carrying out Perry's execution, and that *Harper* only required that it be shown that Perry's medication was reasonably related to this interest. Justice Cole questioned more fundamentally the assumptions of the majority, maintaining that involuntary medication was in fact a valid treatment, which was in Perry's best interest to relieve his suffering, and which should not be construed as doing him harm, even if it led eventually to his being executed.

Roper v. Simmons, 543 U.S. 511 (2005)

In *Roper v. Simmons,* the U.S. Supreme Court held that the execution of juveniles under the age of 18 at the time of their commitment offense was unconstitutional. This decision overturned the ruling of the court 16 years earlier in *Stanford v. Kentucky*, in which the 5–4 majority determined the execution of juveniles ages 16–18 was not a violation of the Eighth Amendment, applied to the states via the Fourteenth Amendment.

On September 8, 1993, defendant Christopher Simmons, age 17, planned and executed the murder of Shirley Crook. Simmons and two accomplices broke into Mrs. Crook's house, bound and gagged her, and tossed her body off a bridge, to her death. At school the next day, Simmons bragged about the murder to classmates; he was subsequently arrested, charged with first-degree murder, convicted, and sentenced to death.

In 2004, the Supreme Court ruled in *Atkins v. Virginia* that execution of the mentally retarded constituted cruel and unusual punishment and therefore was unconstitutional via the Eighth Amendment. The majority's reasoning in *Roper* parallels that in *Atkins*.

To reach its conclusion, the majority considered "'the evolving standards of decency that mark the progress of a maturing society,' to determine which punishments are so disproportionate as to be 'cruel and unusual,'" as articulated in *Trop v. Dulles*. The majority argued that since its decision in *Stanford*, a consensus had evolved among the states barring the execution of those under age 18. The court also relied on the rule, established in decisions preceding *Stanford,* that the Constitution contemplates that the court's own judgment can be brought to bear on the question of the acceptability of the death penalty, and with regard to the death penalty for those under 18, judged the punishment excessive.

To reach this conclusion, the majority relied on three main arguments. First, juveniles are susceptible to immature and irresponsible behavior, and therefore, their irresponsible conduct is not as morally reprehensible as that of an adult. Second, their own vulnerability and lack of control over their immediate surroundings mean juveniles are less culpable for failing to escape negative influences. Third, juveniles have not yet established a consistent identity and, therefore, and have a greater chance of rehabilitation compared to adult offenders.

The thrust of the dissent's argument was against a categorical exclusion of those under age 18 from the death penalty, saying that juries are equipped well enough to distinguish on a case-by-case basis those under 18 who deserve the death penalty and those who do not. The dissent noted that in most cases, juries would, and do, find the death penalty excessive for juveniles, but that they therefore can be relied on to render fair judgments. The dissent also took issue with the way the majority determines that a consensus exists among the states, concluding that it does not.

Legal regulation of psychiatry

JAMES W. HICKS

HOSPITALIZATION

Lake v. Cameron, 364 F. 2d 657 (1966)

In *Lake v. Cameron*, the U.S. Court of Appeals for the District of Columbia applied the principle of the "least restrictive alternative" to involuntary commitment of the mentally ill. The U.S. Supreme Court has not endorsed this requirement, but most jurisdictions now require the state to consider alternatives before seeking involuntary hospitalization.

In 1962, a policeman found Catherine Lake, a 60-year-old, senile woman, wandering about Washington, DC, and took her to the D.C. General Hospital, from which she was transferred to St. Elizabeth's Hospital. Lake filed a writ of *habeas corpus*, which was dismissed by the district court without a hearing. At the subsequent commitment hearing, two psychiatrists testified that she had a "chronic brain syndrome" with memory impairments and was unable to care for herself, and she was found to be of "unsound mind" and committed to St. Elizabeth's.

Lake appealed the summary dismissal of her writ, and the D.C. Court of Appeals remanded the case to the district court for a hearing. At the hearing, a psychiatrist testified that Lake was not intentionally dangerous to herself or others, but that she was prone to wandering and had in fact been injured after wandering away from the hospital for more than a day. Lake's husband and sister testified that they were eager for her release and would try to provide for her needs, but the court concluded that they were incapable of doing so. The court denied relief but allowed that Lake might be entitled to release if she were able to find another facility that could take care of her.

Lake appealed again, arguing that passage of new legislation (the D.C. Hospitalization of the Mentally Ill Act) after her hearing required her case be remanded for the court to consider "any other alternative course of treatment which the court believes will be in the best interests of the person or of the public." Plaintiff's court-appointed attorney clarified that Lake objected to total confinement in a mental institution but would accept treatment in a setting more appropriate to her needs.

Chief Judge Bazelon, writing for the D.C. Court of Appeals, applied the principle that a deprivation of liberty to prevent harm to a mentally ill person should be limited to what is necessary to protect that person. The court also reasoned that the state, rather than the indigent patient herself, should bear the burden of exploring alternative resources in the community more suited to the needs of the patient. The case was remanded to the district court for an inquiry into alternative placements, preferably one that Lake would be willing to accept.

Baxstrom v. Herold, 383 U.S. 107 (1966)

In *Baxstrom v. Herold*, the U.S. Supreme Court determined the due process rights of prisoners facing civil commitment at the end of their prison sentence.

Johnnie Baxstromn was committed to a New York prison in 1959 after being convicted of assault. In 1961, a prison physician certified him as "insane" (i.e., suffering from a mental illness), and he was transferred to Dannemora State Hospital, a psychiatric hospital for prisoners. When Baxstrom's penal sentence was about to end, the hospital director applied for civil commitment based on the opinion of two hospital physicians that Baxstrom was still mentally ill and in need of hospital care. Baxstrom appeared alone at the commitment hearing and was only permitted a brief opportunity to ask questions. He was retained at Dannemora State Hospital as a civilly committed patient.

Baxstrom sought a writ of *habeas corpus*, which was dismissed after an independent psychiatrist testified that he remained mentally ill. Baxstrom again applied for a writ of *habeas corpus* in 1963, arguing that he was sane, and that if he were insane, he should be transferred to a civil psychiatric hospital. He was unable to obtain psychiatric testimony on his behalf, and the writ was dismissed again. The appeals court affirmed the dismissal, and the Court of Appeals of New York (the state's supreme court) denied appeal. The U.S. Supreme Court granted *certiorari*.

The court found that New York's statute for civil commitment of a prisoner at the expiration of a penal sentence violated the Equal Protection Clause of the Fourteenth Amendment in two respects. First, all nonprisoners facing civil commitment have the right to a full jury trial to determine whether they are mentally ill. The court found no basis for distinguishing the psychiatric commitment of a prisoner from all other civil commitments. Second, no other person may be committed to a Department of Corrections facility without a judicial finding that they are too dangerously mentally ill to be treated safely in a civil hospital. The court rejected the director's argument that a prisoner's past criminal record was sufficient proof of dangerousness, and that placement should be an administrative matter.

The court reversed and ordered a new hearing to determine whether Baxstrom was mentally ill, and if so, whether he should remain at Dannemora State Hospital.

Jackson v. Indiana, 406 U.S. 715 (1972)

In *Jackson v. Indiana*, the U.S. Supreme Court determined that a person found incompetent to stand trial, but not yet convicted, may be committed only long enough to restore competence or to determine whether he or she will become competent in the foreseeable future.

In 1968, Theon Jackson was charged with two counts of robbery involving approximately $9 in property and cash. Jackson entered a plea of not guilty. The court ordered a competency assessment, because Jackson was mentally retarded, deaf, and mute and could communicate only through limited sign language. Two physicians concluded that Jackson was unable to understand the nature of the charges against him or to participate in his defense. One physician testified that Jackson was unlikely ever to learn to communicate more effectively, and that his "prognosis appears rather dim." The other physician testified that Jackson was likely to be incompetent on the basis of his intelligence alone, even if he were not deaf and mute.

The trial court found Jackson incompetent to stand trial and committed him to the Indiana Department of Mental Health until "the defendant is sane." Indiana law did not require periodic review by the court or by mental health authorities. Jackson's attorney filed a motion for a new trial, arguing that his client would never become competent to stand trial, and that his commitment amounted to a "life sentence" without being convicted of a crime. The trial court denied the motion. The Indiana Supreme Court affirmed the original commitment. The U.S. Supreme Court granted *certiorari*.

The court found that Indiana's indefinite commitment of a person as incompetent to stand trial violated both the Equal Protection and Due Process Clauses of the Fourteenth Amendment. In addressing equal protection, the court relied on the previous ruling in *Baxstrom v. Herold* (see above), which found that a prisoner approaching the end of his or her sentence could not be committed as mentally ill without the protections provided to all others facing civil commitment. If criminal conviction does not justify less protection during commitment, then "the mere filing of criminal charges surely cannot suffice." The court found that Jackson was subjected to a more lenient commitment standard and to a more stringent standard of release than if he had not been charged with an offense.

In addressing due process, the court noted that the nature and duration of commitment must bear some "reasonable relation" to the purpose of commitment. Federal law and the laws in several states do not permit the continued commitment of those found incompetent to stand trial unless they are likely to become competent or are found to be dangerous. The court concluded that a person found incompetent to stand trial "cannot be held more than the reasonable period of time necessary to determine whether there is a substantial probability that he will attain that capacity in the foreseeable future." If an incompetent person is likely to be restored to fitness, then his or her "continued commitment must be justified by progress toward that goal." If not, then he or she must be released or committed according to civil commitment procedures.

The court chose not to establish arbitrary time limits for restoring competency but noted that Jackson had been confined already for over 3 years even though he was unlikely to ever become competent. The court reversed, remanded, and recommended that the trial court consider dismissing the charges or holding a limited trial to establish innocence or insanity.

Lessard v. Schmidt, 349 F. Supp. 1078 (1972)

In *Lessard v. Schmidt*, the Wisconsin District Court established broad due process rights in civil commitment. Although these rights were subsequently incorporated into many state statutes, the U.S. Supreme Court has never ruled on the minimum constitutional standards for civil commitment.

In 1971, Alberta Lessard was picked up in front of her house by two police officers, who took her to the Mental Health Center in Milwaukee, Wisconsin. She was detained for 4 days on an emergency basis without a hearing. Her confinement was extended for 10 days following an appearance by the police officers before the judge. The Mental Health Center then requested that she be permanently committed as suffering from schizophrenia. Lessard was not informed of any of the proceedings. At the commitment hearing, which took place 24 days after her initial detention, the judge found her to be "mentally ill" and committed her for 30 days. Her commitment was subsequently extended every 30 days for nearly a year.

On her own initiative, Lessard retained an attorney, who filed a class action in federal district court under 42 U.S.C. Section 1983, which provides relief to any person deprived of their constitutional rights by state statute. Lessard argued that Wisconsin's involuntary commitment statute deprived her, and all others held involuntarily under its provision, of due process rights. The district court agreed to hear the case and agreed that the statute was unconstitutional.

The court emphasized that only a compelling state interest can justify denial of the fundamental "liberty to go unimpeded." Traditionally, the deprivation of liberty inherent in civil commitment has been justified both by the police power of the state (to protect the community from the dangerous actions of the mentally ill) and by the *parens patriae* role of the state (to provide treatment to those who would not willingly seek help). The court questioned the *parens patriae* role, noting that many mental illnesses are untreatable, the quality of institutional treatment may be inadequate and lengthy, and involuntary hospitalization may worsen health. The court quoted the famous pronouncement by Justice Brandeis: "Experience should teach us to be most on our guard to protect liberty when the government's purposes are beneficent…. The greatest dangers to liberty lurk in insidious encroachment by men of zeal, well-meaning but without understanding."

The stringent safeguards provided to arrested persons facing imprisonment had not been provided in civil commitment cases. The court observed that the deprivation of liberty in the civil and criminal contexts is comparable. Individuals civilly committed to a mental institution in Wisconsin lost numerous civil rights, including the presumption of competency, the right to make contracts and sue, the right to marry, the right to professional licenses, and the right to drive, vote, and serve on juries. The court observed that committed individuals were likely to face tremendous stigma and difficulties returning to life outside of the institution. The court referred to the U.S. Supreme Court decision in *In re Gault, 387 U.S. (1967),* in which adult criminal procedural safeguards were extended to juvenile court, which had historically been treated as civil in spite of the significant deprivations of liberty.

The district court established the following procedural safeguards constitutionally required for commitment of the mentally ill. The patient must be given timely notice of the "charges" and notice of all rights, including the right to a jury trial. A probable cause hearing must be held within 48 hours. The patient has the right to representation by an attorney. Hearsay evidence may not be admitted in the hearing. The patient retains the privilege against self-incrimination and must be informed that any information provided during examination may be used against him or her in the hearing. The state must prove beyond a reasonable doubt that the patient is both mentally ill and dangerous. Finally, the state must demonstrate that less restrictive alternatives to commitment are not available or not suitable.

Lessard was ordered released. Wisconsin was given 90 days to review its commitment procedures and determine whether all patients currently detained should be released, converted to voluntary status, or recommitted in conformity with the ruling.

O'Connor v. Donaldson, 422 U.S. 563 (1975)

In *O'Connor v. Donaldson*, the U.S. Supreme Court ruled against the involuntary custodial confinement of the nondangerous mentally ill without meaningful care or treatment. The court did not uphold the lower courts' articulation of a broad right to treatment (see *Donaldson v. O'Connor* below).

Kenneth Donaldson was committed to the Florida State Hospital at Chattahoochee in 1957 on the initiative of his father. Donaldson was diagnosed with paranoid schizophrenia and committed for "care, maintenance, and treatment." Donaldson repeatedly requested discharge during his nearly 15 years of hospitalization, claiming that he was not dangerous, not mentally ill, and not receiving treatment. The hospital superintendent, Dr. O'Connor, repeatedly refused Donaldson's request, even though Donaldson had never posed a danger to himself or others.

Almost immediately after O'Connor's retirement, Donaldson was released by the hospital. He immediately filed suit for damages in federal district court, alleging that O'Connor had intentionally and maliciously deprived him of his constitutional right to liberty. O'Connor countered that he had acted in good faith in his belief that state law authorized indefinite custodial confinement of the mentally ill. He also claimed that he believed Donaldson would have been unable to make a "successful adjustment outside the institution," though he gave no reason for this opinion. In fact, Donaldson had been successfully employed for many years before his confinement and obtained a job in hotel administration after his release. Responsible acquaintances had repeatedly promised to provide any needed support if he were released.

In federal district court, the jury returned a verdict against O'Connor and awarded compensatory and punitive damages. The court of appeals affirmed the judgment and delivered a broad opinion, finding in the Fourteenth Amendment a right to treatment for persons involuntarily committed (see *Donaldson v. O'Connor* below). The U.S. Supreme Court granted *certiorari* but chose not to address whether patients have a right to treatment.

The Supreme Court held that "a State cannot constitutionally confine without more a non-dangerous individual who is capable of surviving safely in freedom by himself or with the help of willing and responsible family members or friends." The phrase "without more" generally has been interpreted to mean "without further justification" rather than "without treatment." However, the court vacated the district court's judgment and remanded for a new trial in light of a recent ruling on the scope of immunity possessed by state officials.

Addington v. Texas, 441 U.S. 418 (1979)

In *Addington v. Texas*, the U.S. Supreme Court established "clear and convincing evidence" as the minimum standard of proof for civil commitment.

In 1975, the mother of Frank Addington petitioned the Texas trial court to commit her son to a mental hospital in accordance with Texas law. Addington requested a trial, at which the jury was instructed to determine by a standard of "clear, unequivocal, and convincing evidence" whether he was mentally ill and required hospitalization for his

protection or the protection of others. The jury found for commitment, and Addington was committed to the Austin State Hospital for an indefinite period.

Addington appealed, and the court of appeals agreed with his contention that the standard for commitment should have been "beyond a reasonable doubt," the same standard required for criminal conviction. The Texas Supreme Court reversed, stating that the appropriate standard for civil commitment is a "preponderance of the evidence" (i.e., more likely than not). Because the higher standard used in the jury instruction was to Addington's advantage, the error was harmless, and the judgment was reinstated. The U.S. Supreme Court granted *certiorari*.

The U.S. Supreme Court reflected that the standard of proof serves to allocate the risk of error between the parties and to indicate the importance of the decision. In criminal cases, the consequences of criminal punishment are severe. The most stringent standard of "beyond a reasonable doubt" indicates that society should take nearly the entire risk of error upon itself. In most civil cases, fairness argues that neither party should be favored, unless a strong social policy is at stake. The least stringent standard of a "preponderance of the evidence" splits the risk of error between the two parties. In some civil cases, an intermediate standard of "clear and convincing evidence" has been employed where the interests at stake are "more substantial than mere loss of money." This intermediate standard is used in proceedings for deportation or removal of parental rights.

The court considered each of the three standards in turn. Civil commitment is a significant deprivation of liberty with adverse consequences for the committed individual. Because the individual should not share equally the risk of error with society, a standard of a "preponderance of the evidence" does not adequately protect the individual's rights. On the other hand, a standard of "beyond a reasonable doubt" should not be required. In civil commitment, the state does not exercise its power for punishment but for treatment. An individual who is erroneously released may suffer as a result. On a practical note, the court opined that, "Given the lack of certainty and the fallibility of psychiatric diagnosis, there is a serious question as to whether a state could ever prove beyond a reasonable doubt that an individual is both mentally ill and likely to be dangerous."

The court determined that an intermediate level of proof by "clear and convincing evidence" would fairly balance the interests of the state and the rights of the individual. Half of the states were already using this standard for civil commitment. States could choose to use an even higher standard, but this was not required. The case was vacated and remanded to the Texas Supreme Court to determine whether to continue to include the term "unequivocal" in the state's standard.

Parham v. J.R., 442 U.S. 584 (1979)

In *Parham v. J.R.*, the U.S. Supreme Court declined to extend to children the full gamut of procedural safeguards that had been established for adults facing civil commitment.

J. R. was one of two plaintiffs in a class action brought in federal court by all minors detained for psychiatric treatment in Georgia. (The other plaintiff, J. L., died before the case was decided.) The two boys had been admitted to Central State Regional Hospital on a voluntary basis by their parents due to uncontrollable disruptive behaviors. J. R. was admitted at the request of his seventh set of foster parents. J. L. was committed by his own parents, but he became a ward of the state when his parents relinquished their parental rights.

Georgia's statute for voluntary commitment of juveniles required that a parent or guardian sign an application. The hospital superintendent then must find "evidence of mental illness" and that the child is "suitable for treatment" in the hospital. J. R. argued that Georgia's commitment procedures for minors violated the Due Process Clause of the Fourteenth Amendment. The district court agreed, noting that commitment is a severe deprivation of liberty requiring, at a minimum, the right to receive notice and be heard before "an impartial tribunal." The court also determined that the state had failed to provide adequate resources for outpatient treatment and ordered Georgia to expend whatever resources necessary. The state appealed, and the U.S. Supreme Court granted *certiorari*.

The Supreme Court held that Georgia's procedure for the voluntary commitment of minors was constitutional. A due process claim should be tested by balancing three factors: the private interest of the individual, the potential consequences of an erroneous decision for the individual, and the government's interest. The court found that though a child has a liberty interest in not being committed, voluntary commitment of a child (by a parent) does not carry the same stigma as involuntary commitment of an adult. A child might be seriously harmed if he or she fails to receive needed treatment. The private interest at stake includes the interest of the parents, who are obliged for the welfare of the child. The court stressed the traditional presumption that the "natural bonds of affection lead parents to act in the best interests of their children." In the absence of abuse and neglect, the parents should "retain a substantial, if not the dominant, role in the decision… subject to a physician's independent examination and medical judgment."

The court noted that adversarial judicial proceedings would deter parents from seeking treatment for their children, would distract physicians from more important clinical duties, and would not improve the quality of the ultimate decision, which is a medical matter. The court found evidence that admitting psychiatrists had "acted in a neutral and detached fashion in making medical judgments in the best interests of the children." State psychiatrists, in fact, declined to admit many children brought in by their parents.

Justice Brennan wrote a minority opinion dissenting in part. Parents often do not have the best interest of their children in mind when they seek commitment, and children are particularly vulnerable to deprivation of rights. He argued for post-commitment judicial review with traditional due process safeguards.

Vitek v. Jones, 445 U.S. 480 (1980)

In *Vitek v. Jones*, the U.S. Supreme Court determined that a prisoner still serving a sentence is entitled to procedural protections before being transferred to a mental hospital.

In 1974, Larry Jones was sentenced to prison in Nebraska for a charge of robbery. In 1975, he was placed in solitary confinement, where he set his mattress on fire and suffered severe burns. After recovering, he was transferred pursuant to state law to the secure unit of the Lincoln Regional Center, a state mental hospital. The director of correctional services was authorized to transfer a prisoner to an outside institution for examination and treatment. The transfer could only occur when a designated physician or psychologist concluded that the prisoner suffered from a mental disease or defect and could not be given proper treatment in the prison facility. Jones challenged his transfer and the statute as a violation of procedural due process under the Fourteenth Amendment. The district court agreed. The state appealed.

Though Jones had been released on parole, the U.S. Supreme Court decided that the case was not moot and granted *certiorari*. The court agreed that Jones possessed a liberty interest in avoiding transfer to a mental hospital. A liberty interest was created by the statute, which required that a physician find a prisoner to be suffering from a mental disease or defect. This required proper procedures to ensure an accurate finding.

A liberty interest was also found to exist in the Fourteenth Amendment. A convicted prisoner has lost his right to freedom from confinement but retains "a residuum of liberty that would be infringed by a transfer to a mental hospital." The stigma and involuntary treatment that may result from transfer to a psychiatric hospital are "qualitatively different from the punishment characteristically suffered by a person convicted of crime."

The Supreme Court agreed with the district court's minimum required procedures, including written notice, an adversarial hearing with the opportunity to present testimony and cross-examine witnesses, an independent decision maker, notice of rights, and availability of legal counsel. A prisoner facing a finding of mental illness is entitled to independent legal assistance, but a licensed attorney is not required.

Jones v. United States, 463 U.S. 354 (1983)

In *Jones v. United States*, the U.S. Supreme Court chose not to extend the due process protections established in earlier cases to the category of individuals adjudicated not guilty by reason of insanity (NGRI).

In 1975, Michael Jones was arrested for attempting to steal a jacket from a department store. He faced a maximum prison sentence of 1 year. Following his arrest, he was committed to St. Elizabeth's Hospital in the District of Columbia for a determination of his competency to stand trial. He was diagnosed with schizophrenia but found to be fit. He entered an uncontested plea of not guilty by reason of insanity. At the subsequent hearing, he was recommitted to St. Elizabeth's on the basis of testimony that his illness was "still quite active." After more than 1 year in the hospital, he petitioned the court to be released unconditionally or recommitted pursuant to civil commitment standards including a jury trial and proof by clear and convincing evidence that he was currently mentally ill and dangerous. The superior court and court of appeals both rejected his argument. The U.S. Supreme Court granted *certiorari*.

Jones relied on the earlier decision in *Addington v. Texas* (see above) that established a minimum standard of "clear and convincing evidence" for commitment. He indicated that his commitment was based on a standard of a preponderance of the evidence. He also argued that the finding that he was currently mentally ill and dangerous had been based on the earlier finding that he was insane at the time of the offense. He argued that if the state automatically commits insanity acquittees, the commitment can be reasonably justified only for the length of the maximum prison sentence that the acquittee would have served if convicted. After that, civil commitment standards must be used.

The court observed that the finding of insanity at the time of the offense is highly probative of mental illness and dangerousness at the time of the subsequent commitment hearing. The court maintained that a finding beyond a reasonable doubt that a person has committed a criminal act "certainly indicates dangerousness." A nonviolent crime against property therefore could constitute dangerousness. The court also reasoned that a person who has committed a criminal act as a result of mental illness is likely to remain ill and in need of treatment for some time. In contrast to the situation in *Addington*, the insanity acquittee has acknowledged mental illness as a criminal defense, so a higher standard of proof is not required to reduce the risk of unfair stigma or unneeded treatment. A standard of a preponderance of the evidence is sufficient for due process purposes for commitment of insanity acquittees.

In his argument regarding the length of commitment, Jones had relied on the holding in *Jackson v. Indiana* (see above) that "the nature and duration of commitment bear a reasonable relation to the purpose for which the individual is committed." However, the purpose of commitment of an insanity acquittee is treatment, not punishment. There is no correlation between the severity of offense for which a defendant was charged and the length of time necessary for an insanity acquittee to recover from mental illness. The court concluded that "when a criminal defendant establishes by a preponderance of the evidence that he is not guilty of a crime by reason of insanity, the Constitution permits the government, on the basis of the insanity judgment, to confine him to a mental institution until such time as he has regained his sanity or is no longer a danger to himself or society."

In dissenting opinions, four justices argued that past criminal behavior and mental illness should not justify indefinite future commitment, particularly following a

single, nonviolent misdemeanor. They argued that "at some point the Government must be required to justify further commitment under the standards of *Addington*."

Zinermon v. Burch, 494 U.S. 113 (1990)

In *Zinermon v. Burch*, the U.S. Supreme Court recognized a deprivation of liberty in the voluntary hospitalization of an individual who was not competent to consent to the admission.

In 1981, Darrell Burch was found wandering in a disoriented state along a Florida highway. When evaluated at a community mental health service in Tallahassee, he was found to be hallucinating and confused. He believed that he was "in heaven." He signed forms giving consent to admission and treatment. He was diagnosed with schizophrenia and treated with psychotropic medication. He was transferred to Florida State Hospital in Chattahoochee for further treatment. He signed additional forms requesting voluntary admission and treatment, including an "Authorization for Treatment" cosigned by his attending physician, Dr. Zimmerman. Progress notes from the hospital indicated that Burch was unable to state the reason for his hospitalization and continued to believe that he was in heaven. He was hospitalized for 5 months.

In 1985, Burch filed a complaint in district court under 42 U.S.C. Section 1983, which provides relief to any person deprived of his or her constitutional rights by state statute. He alleged that staff at the two hospitals "knew or should have known that Plaintiff was incapable of voluntary, knowing understanding and informed consent to admission and treatment at FSH." Burch argued that he had been involuntarily hospitalized without legally adequate consent, thus depriving him of his liberty without due process in violation of the Fourteenth Amendment. The district court dismissed the action, stating that there was no federal remedy for an alleged, random, unauthorized violation of Florida law. The court of appeals reversed, and the U.S. Supreme Court granted *certiorari*.

The court held that state hospital employees admitted Burch as a voluntary patient without determining whether he was mentally competent to sign the voluntary admission forms, and that this was sufficient to state a federal claim for damages. By statute, Florida required informed consent for voluntary psychiatric hospitalization. It is foreseeable that a person with mental illness might be unable to give a knowing consent to admission. Therefore, he or she was in danger of being confined indefinitely without the procedural safeguards of involuntary commitment. If Burch had undergone an involuntary commitment hearing, he might have been released. Even if he were confined, he would have gained certain protections, including the appointment of a guardian and periodic judicial review.

In a dissenting opinion, several justices argued that the state should not be held liable for the "unauthorized and wrongful… departure from established state practice" by particular state employees.

THE RIGHT TO TREATMENT

Rouse v. Cameron, 373 F. 2d 451 (1966)

In *Rouse v. Cameron*, Chief Judge Bazelon, writing for the Court of Appeals for the District of Columbia, extended the statutory right to treatment for civilly committed patients to an individual hospitalized after an acquittal by reason of insanity.

Charles Rouse was found not guilty by reason of insanity on a misdemeanor charge of carrying a dangerous weapon and was committed to St. Elizabeth's Hospital in the District of Columbia in November 1962. If he had been found guilty, he would have faced a maximum sentence of 1 year. He was later given a diagnosis of "Antisocial Reaction." He was confined as dangerously mentally ill for 4 years before he filed a writ of *habeas corpus* in district court. He argued, among other things, that the hospital was not providing him treatment for his mental illness.

The district court denied relief and refused to consider Rouse's argument that he had received no psychiatric treatment. The court concluded that its jurisdiction was limited to whether he remained mentally ill and dangerous. Rouse appealed.

The court of appeals observed that the purpose of involuntary hospitalization is treatment rather than punishment. Without treatment, a hospital is no better than a penitentiary. Civilly committed patients had a statutory right to treatment through the federal Hospitalization of the Mentally Ill Act of 1964, and many states recognized by statute a right to treatment. The court speculated that indefinite confinement without treatment might violate the Equal Protection Clause and might be considered "cruel and unusual punishment" under the Constitution.

The court acknowledged numerous practical limitations to the provision of treatment to committed mentally ill patients, including staff shortages and disagreement among professionals about appropriate treatments. The hospital must only show that "bona fide efforts" at treatment have been made, not that a patient has been cured or has improved with treatment.

The court concluded, "The patient's right to treatment is clear," and remanded to the trial court for a hearing on whether Rouse had received adequate treatment. In a dissenting opinion, one judge argued that Rouse himself had contended during the course of hospitalization that he was not mentally ill and needed no treatment, so his allegation that the hospital was providing him no treatment was simply a legal strategy.

Wyatt v. Stickney, 344 F. Supp. 373 (1972)

In *Wyatt v. Stickney*, Judge Johnson, writing for the Alabama District Court, established specific minimum standards for proper treatment and care in a state facility for the mentally retarded. Similarly extensive and detailed standards were

subsequently incorporated into numerous state regulations regarding the care of the mentally ill.

Ricky Wyatt was a mentally retarded patient confined involuntarily at Bryce Hospital in Tuscaloosa, Alabama. In 1970, a class action suit was filed on his behalf alleging poor treatment and horrible conditions of confinement. In 1971, the district court agreed that patients at Bryce Hospital were subjected to brutal, unsanitary, and dangerous conditions. The court ruled that "to deprive any citizen of his or her liberty upon the altruistic theory that the confinement is for humane therapeutic reasons and then fail to provide adequate treatment violates the very fundamentals of due process."

The court found that Bryce Hospital failed to provide a safe and humane environment, a sufficient number of qualified staff, and individualized treatment. The court held that involuntarily committed patients "unquestionably have a constitutional right to receive such individual treatment as will give each of them a realistic opportunity to be cured or to improve his or her mental condition." Bryce Hospital was given 6 months to improve the level of care.

At a subsequent hearing, the court found that the hospital continued to be grossly deficient and had failed to satisfy minimum medical and constitutional standards. The court invited the various parties and *amici* to propose standards for constitutionally adequate treatment. After considering the submissions, Judge Johnson issued an Order and Decree of 1972 detailing the minimum constitutional standards for adequate treatment of the mentally ill. The court declined to appoint a master to oversee the implementation of the standards, to issue an injunction against further commitments, or to appropriate funding from the state's budget. However, the court said that "the very preservation of human life and dignity" were at stake, and that these measures would be taken if necessary.

The minimum standards included a "humane psychological and physical environment," "qualified staff in numbers sufficient to administer adequate treatment," and "individualized treatment plans." The standards included such details as the appropriate temperature for hot water and minimum staff-to-patient ratios.

Donaldson v. O'Connor, 493 F.2d 507 (1974)

Kenneth Donaldson was hospitalized for nearly 15 years at the Florida State Hospital at Chattahoochee before filing suit for damages in federal court in 1971. He argued that he had a constitutional right to receive treatment or be released. In its initial holding, the district court of appeals considered for the first time "the far-reaching question whether the Fourteenth Amendment guarantees a right to treatment to persons involuntarily civilly committed to state mental hospitals."

Donaldson was committed in 1957 upon the petition of his father, who believed he was experiencing delusions. Throughout his hospitalization, he refused to take any medication or receive electroconvulsive therapy. No other therapy was offered. He was denied ground privileges, occupational therapy, and the opportunity to speak at any length with a psychiatrist. His attending psychiatrist accorded him the same treatment that he provided to nine hundred other patients, even though Donaldson's condition appeared to be in remission. He was not given the opportunity for outpatient care, even though a variety of third parties offered to provide him assistance and supervision. Finally, there was no evidence in the record that Donaldson had ever been violent in any way.

The district court of appeals referred to an influential 1960 article in the *American Bar Association Journal* by Dr. Morton Birnbaum, who argued that treatment serves as a *quid pro quo* justification for hospitalization. In exchange for his or her loss of freedom, the patient receives treatment. The court also referred to *dicta* in the case of *Rouse v. Cameron* (see above) that a constitutional right to treatment might exist.

The court found that a right to treatment exists in the Due Process Clause of the Fourteenth Amendment. Civil commitment is a "massive curtailment of liberty" that cannot be justified except for some permissible governmental goal. When a person poses a danger to himself or others, the restriction is justified by the government's interest in preserving safety. When a nondangerous person is committed, only the provision of treatment can justify the deprivation of liberty. The court held that "minimally adequate treatment" must be provided, defined as "the provision of rehabilitative treatment, or, where rehabilitation is impossible, minimally adequate habilitation and care, beyond the subsistence level custodial care that would be provided in a penitentiary."

The court concluded, "We hold that a person involuntarily civilly committed to a state mental hospital has a constitutional right to receive such individual treatment as will give him a reasonable opportunity to be cured or to improve his mental condition."

His case was eventually heard before the U.S. Supreme Court (*O'Connor v. Donaldson*, 1975), which ruled against the involuntary confinement of a nondangerous, mentally ill individual, but did not endorse the lower court's ruling regarding a constitutional right to treatment.

Estelle v. Gamble, 429 U.S. 97 (1976)

In *Estelle v. Gamble*, the U.S. Supreme Court established "deliberate indifference" to an inmate's medical needs as a form of cruel and unusual punishment barred by the Constitution.

J. W. Gamble was an inmate in the Texas Department of Corrections when he claimed to have injured his back. In 1973, a bale of hay fell on him while he was performing a prison work assignment. He was seen by a medical assistant and prescribed pain medication. The following day, he was seen by a prison physician who diagnosed lower back pain and prescribed a muscle relaxant. Over the next

3 months, Gamble was seen by prison health personnel a total of 17 times. His treatment was complicated several times by staff failure. A prescription was not filled for 4 days because staff lost the prescription. Staff failed to carry out a doctor's order to move him to a lower bunk bed. Prison guards refused to allow Gamble to see a physician for chest pain, even though he had been diagnosed with an irregular cardiac rhythm. An x-ray of his back was never ordered.

Gamble was twice brought before the prison disciplinary committee due to his refusal to resume work. In both cases, prison health personnel testified that Gamble was capable of returning to work. Gamble filed suit against the director of the Department of Corrections, the prison warden, and the medical director under 42 U.S.C. Section 1983, which provides relief to any person deprived of their constitutional rights by state statute. The district court dismissed the complaint, and the court of appeals reversed. The Supreme Court granted *certiorari*.

Gamble claimed that he been subjected to cruel and unusual punishment in violation of the Eighth Amendment of the Constitution. The intent of the drafters of the Constitution was to prevent torture and other barbarous methods of punishment. However, courts have extended the protection consistent with "the evolving standards of decency that mark the progress of a maturing society." Since an inmate must rely on prison staff for all medical treatment, denial of medical care by prison staff "may result in pain and suffering, which no one suggests would serve any penological purpose."

The court held that "deliberate indifference to serious medical needs of prisoners" should be the standard for determining whether a violation of the Eighth Amendment exists. The court distinguished such actions from an accident or other inadvertent failure to provide treatment. A prisoner should seek tort relief, rather than a constitutional remedy, for inadvertent medical malpractice. The court noted that Gamble had been seen by medical personnel on 17 occasions and concluded that he had not stated a sufficient claim for violation of his constitutional rights.

In a dissenting opinion, Justice Stevens argued that the determination whether a constitutional right had been violated should be based not on the motivation of prison staff but on the nature of the harm done.

Youngberg v. Romeo, 457 U.S. 307 (1982)

In *Youngberg v. Romeo*, the U.S. Supreme Court established a right to "minimally adequate or reasonable training to ensure safety and freedom from undue restraint" for the mentally retarded in a state institution. The court also established a standard of professional judgment when evaluating the treatment provided.

Nicholas Romeo was a profoundly mentally retarded young man who was involuntarily committed to Pennhurst State School and Hospital by his mother. While hospitalized, Romeo was injured on many occasions, as a result of both his own violence and attacks by other residents. Romeo's mother filed suit in district court in 1976 seeking damages against Pennhurst for failing to protect her son. She claimed that Pennhurst violated his rights under the Eighth and Fourteenth Amendments.

After the suit was filed, Romeo was transferred to another hospital for treatment of a broken arm. He was physically restrained on a daily basis to prevent him from harming others. Pennhurst left Romeo in the hospital under those conditions pending settlement of the suit. In response, Romeo's mother filed a second suit claiming that he was restrained for prolonged periods on a routine basis and that the hospital had failed to provide him with appropriate treatment for his mental retardation. The jury returned a verdict for the defendants.

The court of appeals reversed and remanded for a new trial, holding that the Fourteenth Amendment, rather than the Eighth, was the appropriate source for the rights of a committed patient. The Fourteenth Amendment establishes a liberty interest in freedom of movement and personal security. The court also found a fundamental liberty interest in "habilitation" intended to treat mental retardation. In determining whether a hospital had violated this right, courts should defer to medical judgment. The Constitution only requires the courts to ensure that "professional judgment in fact was exercised" in administering treatment.

The U.S. Supreme Court granted *certiorari* in order to determine, for the first time, whether a patient has a "constitutionally protected liberty interest in safety, freedom of movement, and training within the institution." The court found that Romeo's claim to safe conditions must be valid, since even prisoners have such a right. The right to freedom from bodily restraint is "the core of the liberty protected by the Due Process Clause."

The court found Romeo's assertion of a "constitutional right to minimally adequate habilitation" more controversial. Generally, the state does not have a constitutional duty to provide services. Even when a person is wholly dependent on the state, the state is permitted considerable discretion. The court concluded that the Fourteenth Amendment does require the state to provide "minimally adequate or reasonable training to ensure safety and freedom from undue restraint." The court did not consider whether an involuntarily committed patient has a right to additional treatment.

The court acknowledged that the state has interests, such as the need to protect other residents, which compete with the patient's liberty interests. To balance these interests, the court upheld the "professional judgment" standard articulated by the court of appeals. A professional decision is presumed to be valid, and "liability may be imposed only when the decision by the professional is such a substantial departure from accepted professional judgment, practice, or standards as to demonstrate that the person responsible actually did not base the decision on such a judgment." A professional may be immune from liability in cases where budgetary constraints limit treatment.

The court vacated the decision of the court of appeals and remanded to the district court for further proceedings.

Farmer v. Brennan, 114 S.Ct. 1970 (1994)

In *Farmer v. Brennan*, the U.S. Supreme Court determined that a subjective standard should be used when evaluating claims of deliberate indifference in the care and custody of prisoners.

In 1989, Dee Farmer was beaten and raped by a cellmate within 2 weeks of her transfer to the federal penitentiary in Terre Haute, Indiana. Farmer was a transsexual (born male) who had undergone estrogen therapy, silicone breast implants, and unsuccessful surgical removal of testicles prior to her arrest. In prison, she continued to receive smuggled hormone treatment and to wear clothing in a feminine manner. She was sometimes housed in the general (male) prison population but was more often segregated because of safety concerns or violations of prison rules. She was transferred to Terre Haute for disciplinary reasons. Prior to her rape, she had raised no objection to prison officials regarding her transfer or placement in the general population.

Farmer filed suit in federal court, alleging that her Eighth Amendment rights had been violated when prison officials placed her in the general population "despite knowledge that the penitentiary had a violent environment and a history of inmate assaults, and despite knowledge that petitioner, as a transsexual who 'projects feminine characteristics,' would be particularly vulnerable to sexual attack by some USP-Terre Haute inmates." The district court granted summary judgment, concluding that there had been no deliberate indifference. Prison officials had no "actual knowledge" of danger and were not "reckless in a criminal sense." The court of appeals agreed. The U.S. Supreme Court granted *certiorari* in order to define the term "deliberate indifference."

The Eighth Amendment requires prison officials to provide food, clothing, shelter, and medical care and to take reasonable measures to guarantee safety. Permitting prisoners to be violently assaulted serves no "legitimate penological objective." The case of *Estelle v. Gamble* (see above) set the standard of "deliberate indifference" for determining whether the Eighth Amendment has been violated, and most courts had equated this with "recklessness," which lies somewhere between neglect and intent.

The court held that a subjective test must be applied to determine whether deliberate indifference exists, because the Eighth Amendment outlaws cruel and unusual "punishments" rather than "conditions." Therefore, "an official's failure to alleviate a significant risk that he should have perceived but did not, while no cause for commendation, cannot under our cases be condemned as the infliction of punishment." Likewise, a prison official who responds reasonably to a substantial risk will not be liable even if the harm occurs. On the other hand, the judge or jury can conclude that a prison official knew of a substantial risk from "the very fact that the risk was obvious."

Having defined the appropriate standard, the court remanded the case.

Brown v. Plata, 134 S. Ct. 436 (2011)

In *Brown v. Plata*, the Supreme Court upheld a district court order forcing California to drastically reduce its prison population in order to correct deficiencies in the provision of medical and psychiatric care that had been held to violate the Eight Amendment.

The case began as two separate class action suits that involved prisoners with serious mental illnesses (*Coleman v. Brown*, initiated in 1990) and medical conditions (*Plata v. Brown*, initiated in 2001). The state prisons at the time were operating with approximately twice as many inmates as the facilities had been designed to hold, and staffing was comparably inadequate. Overcrowding created unhealthy conditions (with, for example, more than 50 prisoners sharing a single toilet and suicidal inmates confined in cages the size of a telephone booth) as well as competition for medical evaluation and treatment. Only half the budgeted positions for psychiatrists were filled. The suicide rate was nearly 80% higher than the national prison average, and more than two-thirds of suicides were thought to be foreseeable or preventable. Sick inmates were held in congested cages for hours, and urgent medical care might be delayed for months due to long referral wait lists. Independent surveys found extreme departures from standard practice "widespread" and the proportion of preventable deaths "extremely high."

Separate district courts appointed receivers in 1995 (in *Coleman*) and 2005 (in *Plata*) to oversee the state's remedial plans, but overcrowding persisted, and conditions in the prisons continued to deteriorate. In 2006, the governor declared a state of emergency, announcing that "immediate action is necessary to prevent death and harm caused by California's severe prison overcrowding." Plaintiffs in the two actions asked the district courts to consolidate the cases and convene a three-judge court, in accordance with the federal Prison Litigation Reform Act of 1995, which stipulated that only such a court can compel a state to limit its prison population. The three-judge court ordered California to reduce the population to 137.5% of the prisons' design capacity, which would require the release of approximately forty thousand inmates over 2 years. The state appealed to the Supreme Court.

The Supreme Court found that inmates' constitutional rights were being violated, that overcrowding was the primary cause of the violations, that the state had been given sufficient time to correct the deficiencies, and that the order to reduce overcrowding was both necessary and narrowly drawn. The court rejected the state's argument that the need to release some prisoners who were healthy and thus not a party to the actions made the order overly broad, noting that even healthy inmates are not "remote bystanders [but] that system's next potential victims." The court also concluded that the prison population could be reduced while preserving, or perhaps even improving, public safety. For example, the state could divert low-risk offenders to community programs. The court upheld the district court's order in all respects.

Several justices dissented, arguing that judges should not meddle in policy or attempt to manage state institutions. In his dissent, Justice Scalia suggested that, given the enormity of an order to release forty thousand convicted felons, the court should "bend every effort to read the law in such a way as to avoid that outrageous result." He also argued that the violation of the rights of a "small proportion of prisoners [who] have personally received sufficiently atrocious treatment" could not justify an intervention aimed at all inmates in the system.

RIGHT TO REFUSE TREATMENT

Application of the President and Directors of Georgetown College, Inc., 331 F.2d 1000 (1964)

In *Georgetown College*, Judge Wright of the District of Columbia Circuit Court of Appeals explained his reasoning in issuing an order permitting a hospital to administer an involuntary blood transfusion in an emergency over a patient's religious objections.

Jesse Jones was a 25-year-old mother who was brought to the Georgetown University Hospital by her husband in 1963 after she had lost two-thirds of her blood from a bleeding ulcer. Because of their religious faith as Jehovah's Witnesses, Jones and her husband refused to authorize a blood transfusion to save her life.

As her death became imminent, the hospital applied to a district court judge for permission to administer blood. The judge refused to consider the application, and the hospital's attorney appealed to a judge of the circuit court of appeals. Judge Wright rushed to the hospital and spoke to the patient's husband and doctors. The treating physicians confirmed that Jones would die without blood. The judge interpreted Jones' only audible communication to him, "Against my will," as an indication that she would not feel responsible if the court ordered the transfusion. He signed an order permitting the hospital to administer such transfusions as were necessary to save her life.

In his opinion, the judge clarified that the emergency order was intended to maintain the *status quo*, to prevent the issues raised by the hospital's application from becoming moot through the death of the patient. After receiving the transfusion, the patient recovered, and no further transfusions were needed. The judge noted that there was strong precedent for a single judge to issue an emergency order when it would be impractical to convene a full court. He argued that it was appropriate for the court to consider the issue, because it was unlikely to attract the attention of legislators. If the court did not intervene, such legal issues would be settled only after the fact through civil suits for damages brought by the private parties.

The judge delineated several factors that played a role in his decision and that might be relevant to the full court in reaching a decision after the emergency had passed. When Jones went to the hospital to receive medical attention, she placed the hospital in the position of being legally responsible for her care. Jones was "*in extremis* and hardly *compos mentis* at the time in question" and therefore no more competent than a child would be to make treatment decisions. If she were not competent, her husband would not have the right to prohibit treatment that would save her life. The state has an interest in not allowing a parent to abandon an infant, in this case Jones' 7-month-old son. Jones did not want to die, and if the transfusion were forced upon her by the law, she would not be responsible for the violation of her religious beliefs. Treatment may be forced upon adults for certain contagious diseases, with no exemption for religious beliefs if the community is at risk. Finally, "a life hung in the balance," and there was no time for reflection; the judge chose to "act on the side of life."

The temporary order expired, and the hospital did not apply for another order, because Jones had recovered following the emergency transfusion. Jones later filed a petition for a rehearing by the court of appeals *en banc*, citing the rights of "free exercise of religion and… of a free citizen to have his body inviolate." The petition for a rehearing was denied. In dissenting opinions, judges questioned whether Judge Wright had exceeded his jurisdiction by intervening without the full court and whether the court has any role "when a legally competent adult refuses, on grounds of conscience, to consent to a medical treatment essential to preserve life."

Rennie v. Klein, 720 F.2d 266 (1983)

In *Rennie v. Klein*, the Third Circuit Court of Appeals established for civilly committed patients a right to refuse medication. This is the highest federal court to have ruled on this issue.

John Rennie had been involuntarily hospitalized for the twelfth time at the Ancora Psychiatric Hospital in New Jersey when he instituted a class action suit asserting a right to refuse antipsychotic medication. The district court recognized a constitutional right of involuntarily committed mentally ill patients to refuse antipsychotic medications and granted an injunction. Both parties appealed.

The court of appeals agreed that there exists a constitutional right to refuse treatment, but found that the procedures outlined in New Jersey's Administrative Bulletin 78-3 provided adequate protection of that right. According to the bulletin, a patient who protests the administration of antipsychotic medication must be permitted a meeting with the attending physician at which the reasons for prescribing the drug and the drug's risks and benefits are explained. If the patient continues to refuse treatment, then a meeting with the treatment team is required, and the physician must seek approval from the medical director of the hospital. The medication plan must be reviewed weekly.

The court ruled that the medication administered must be the "least intrusive means" of accomplishing the state's goals. While appeal was pending, the U.S. Supreme Court vacated the court's judgment in *Romeo v. Youngberg* (see

above), which had also utilized a "least intrusive means" analysis. The Supreme Court remanded *Rennie* to the district court of appeals for reconsideration.

On remand, the court found that the decision to override the patient's right to refuse medication must be the product of the medical authority's professional judgment, which "will be presumed valid unless it is shown to be a 'substantial departure from accepted professional judgment, practice or standards.'" Even though its constitutional analysis of the case had changed, the court's holding remained the same: New Jersey's regulations provided sufficient due process protections "without the need for interposing external judicial requirements." The court limited its judgment to the case of mentally ill patients involuntarily committed to a hospital who constitute a danger to themselves or others.

Several members of the court were reluctant to abandon the "least intrusive means" analysis. In a concurring opinion, one judge also commented that the use of medications may not be justified "purely on economic or administrative grounds, as part of an attempt to 'warehouse' the patient."

Rogers v. Commissioner, 458 N.E.2d 308 (1983)

In *Rogers v. Commissioner*, the Supreme Judicial Court of Massachusetts established a broad right for involuntarily committed patients to refuse medication.

Ruby Rogers was one of seven patients committed to Boston State Hospital who filed a class action suit in 1975. They challenged the hospital's practice of secluding and medicating them against their will as a violation of the Constitution. After their complaint was filed, a federal district court judge issued a temporary restraining order prohibiting the use of seclusion or administration of antipsychotic medication to hospitalized patients in nonemergency situations without their consent. At trial, the judge denied damages, because the hospital's practices were in accordance with acceptable medical standards. However, the judge found a constitutional right to refuse treatment in nonemergency situations. This right extended to incompetent patients, for whom the treatment decision should be made by a guardian using a substituted judgment standard. Both parties appealed the decision.

The court of appeals affirmed the denial of damages but remanded on the injunction against involuntary medication. The court found that the physician should balance the interest of the incompetent patient and the state's interest in preventing violence. It did not require the appointment of a guardian for a decision to involuntarily treat an incompetent patient with antipsychotic medication.

The U.S. Supreme Court granted *certiorari*. The court vacated the judgment of the lower courts and remanded to the court of appeals to determine the patient's rights under Massachusetts law (rather than the U.S. Constitution).

The court of appeals looked to the recent Massachusetts case of *Guardianship of Roe* (1981) involving outpatient refusal of antipsychotic medication, in which the substituted judgment determination of a judge could not be delegated to a guardian. The defendants in the current case argued that the interests and needs of the hospital in treating an involuntarily confined patient should be sufficient to transfer the treatment decision from the judge to doctors. They were supported in this argument by *amici* briefs from the American Psychiatric Association and the Massachusetts Psychiatric Society. The court disagreed, noting that hospital physicians have conflicting interests with patients who wish to avoid medication.

The court held that "no State interest justifies the use of antipsychotic drugs in a non-emergency situations without the patient's consent." Involuntary commitment to a hospital for purposes of public safety does not reflect on the judgmental capacity of a patient. A patient may be competent to make some decisions but not others. The right to make decisions about treatment is an essential element of a patient's general right to manage his or her affairs. Therefore, a mentally ill patient committed to a hospital must be considered competent to refuse medication unless found incompetent before a judge. In such a case, the judge must make a substituted judgment decision, which is distinct from what is medically in the best interests of the patient. The judge must determine whether the patient would have consented to the treatment if competent.

In answering a separate question posed by the U.S. Supreme Court, the district court of appeals concluded that "only if a patient poses an imminent threat of harm to himself or others, and only if there is no less intrusive alternative to antipsychotic drugs, may the Commonwealth invoke its police powers without prior court approval to treat the patient by forcible injection of antipsychotic drugs over the patient's objection." Referring to the case of *Guardianship of Roe*, the court also found that, in rare circumstances, under its *parens patriae* powers, the state may medicate a patient in the absence of a threat of violence and without prior court approval to prevent the "immediate, substantial, and irreversible deterioration of a serious mental illness."

Washington v. Harper, 110 S.C. 1028 (1990)

In *Washington v. Harper*, the U.S. Supreme Court considered whether a prisoner is entitled to a judicial hearing when seeking to refuse psychiatric medication.

Walter Harper was sentenced to the Washington State Penitentiary in 1976 for robbery. He was treated with antipsychotic medication on the prison's mental health unit. He was paroled in 1980, but his parole was revoked in 1981 when he assaulted two nurses at the Harborview Medical Center in Seattle. Upon re-incarceration, he was sent to the Special Offender Center, a psychiatric hospital of the Department of Corrections. He was diagnosed with manic–depressive illness and voluntarily treated with antipsychotic medication.

In 1982, Harper refused to continue his medication. His treating psychiatrists sought approval to medicate him involuntarily pursuant to the hospital's policy. According

to the policy, an inmate could be subjected to involuntary treatment with medication only if he suffered from a mental disorder and was either gravely disabled or posed a likelihood of serious harm to himself, others, or property. The inmate was entitled to a hearing before a committee composed of a psychiatrist, a psychologist, and an administrator at the hospital, none of whom were involved in his treatment. The inmate could only be medicated against his or her will if a majority of the committee, including the psychiatrist, agreed that the criteria were met. The inmate had to be given notice of the hearing, of the diagnosis, and of the reason for medication. The inmate had the right to attend, present evidence, and receive the assistance of a lay adviser. The inmate had the right to appeal the decision to the superintendent of the hospital as well as to judicial review in state court. The committee was required to review the case 7 days after the initiation of involuntary treatment, and the treating psychiatrist had to submit a report to the medical director every 14 days during the course of involuntary treatment.

In 1985, Harper filed suit under 42 U.S.C. Section 1983, which provides relief to any person deprived of his or her constitutional rights by state statute, claiming that the state had violated the Due Process, Equal Protection, and Free Speech Clauses of the Constitution. The trial court held that Harper had a liberty interest in refusing antipsychotic medication, but that the policy satisfied the requirements of due process. The Washington Supreme Court reversed, concluding that due process would require a judicial hearing, with the full protections of an adversarial proceeding, in which the state had to prove by "clear, cogent, and convincing" evidence that antipsychotic medication was necessary and effective to further a compelling state interest.

The U.S. Supreme Court granted *certiorari* and first determined that the case was not moot, even though Harper was no longer receiving antipsychotic medication. The court agreed that Harper possessed a liberty interest in refusing antipsychotic medication under the Due Process Clause of the Fourteenth Amendment as well as under state law, because the policy stipulated that medication be administered only under certain conditions. Under the Due Process Clause, however, this liberty interest must be balanced against the prisoner's medical interests and the state's legitimate interest in prison safety and security. The court concluded that "when a prison regulation impinges on inmates' constitutional rights, the regulation is valid if it is reasonably related to legitimate penological interests."

Referring to the prior decision in *Parham v. J.R.* (see above), the court concluded that the Constitution does not prohibit medical personnel, rather than judges, from serving as independent decision makers. The court opined that "prison authorities are best equipped to make difficult decisions regarding prison administration." The court also concluded that a standard of "clear, cogent and convincing" is neither required nor helpful for medical decision making and that it is not required for a lawyer to assist the inmate. The court held that the hospital policy satisfied both substantive and procedural due process requirements.

Riggins v. Nevada, 504 U.S. 127 (1992)

In *Riggins v. Nevada*, the U.S. Supreme Court extended the qualified right of a prisoner to refuse psychiatric medication to an individual facing trial but not yet convicted.

David Riggins was arrested for murder in 1987. Prior to his trial, Riggins was treated with thioridazine for complaints of hearing voices and trouble sleeping. The district court found him to be competent, and the trial proceeded. The defense requested an order to suspend administration of the antipsychotic until the end of trial. They argued that the Fourteenth Amendment and state constitution barred the involuntary administration of antipsychotic medication as an infringement on Riggins' freedom. The defense also argued that Riggins had a right to show jurors his "true mental state" as part of his insanity defense. The state denied the motion.

Riggins presented an insanity defense at trial and testified on his own behalf. The jury found him guilty of murder and sentenced him to death. Riggins appealed to the Nevada Supreme Court.

Among other claims, Riggins argued that the forced administration of antipsychotic medication had denied him the ability to assist in his own defense and prejudicially affected his demeanor at trial. He argued that the state had not demonstrated a need to administer thioridazine and had not explored less intrusive alternatives. The Nevada Supreme Court affirmed the conviction and sentence, holding that the denial of the request to terminate medication was neither an abuse of discretion nor a violation of Riggins' trial rights. The U.S. Supreme Court granted *certiorari* to decide whether forced administration of antipsychotic medication during trial violates the Sixth and Fourteenth Amendments.

The court referred to the previous decision in *Washington v. Harper* (see above) that found it impermissible to involuntarily administer antipsychotic medications to a prisoner without a finding of overriding justification and medical appropriateness. The Equal Protection Clause of the Fourteenth Amendment guarantees that a person detained for trial, but not yet convicted, be provided at least as much protection as a convicted prisoner. Therefore, the state was obligated to determine the need and medical appropriateness of continuing antipsychotic medication once Riggins requested that it be terminated. Due process would have been satisfied if the district court had determined that treatment with antipsychotic medication was medically appropriate and essential for the safety of Riggins and others. The state also might have argued that involuntary treatment was required to maintain Riggins' fitness to stand trial (though the court declined to decide whether this would be a constitutionally sufficient rationale).

The district court's decision presumably was based on weighing the risk that the jury would be swayed by Riggins' outward appearance against the risk that Riggins would become incompetent without medication. Such a decision did not acknowledge Riggins' liberty interest in freedom

from involuntary medication. The U.S. Supreme Court concluded that there was "a strong possibility that Riggins' defense was impaired due to the administration of [thioridazine]." Permitting Riggins to present expert testimony on the effects of the antipsychotic on his demeanor did not resolve the possibility that the medication might adversely affect his testimony, his interaction with his attorney, and his comprehension of the trial proceedings. In the absence in the record of any evidence that the administration of antipsychotic medication was necessary to accomplish an essential state policy, the court reversed and remanded.

Hargrave v. Vermont, 340 F. 3d 27 (2003)

In *Hargrave v. Vermont*, the U.S. Court of Appeals ruled that the state could not discriminate against the mentally ill when pursing involuntary treatment by ignoring a patient's preferences expressed in a durable power of attorney (DPOA) for health care that had been properly executed while the patient was competent.

In 1998, Vermont passed legislation to supersede procedures established by a 1985 consent decree authorizing the involuntary medication of civilly committed individuals following an adjudicatory hearing in which the patient was found incompetent. The consent decree stipulated that the hearing must "ascertain and effectuate the decision that the patient would have made if competent." DPOAs had subsequently been used as evidence of such preferences. Under the new act, a court could override a patient's preferences as articulated in a DPOA if, after 45 days of such treatment, the patient had "not experienced a significant clinical improvement in his or her mental state, and remain[ed] incompetent."

Nancy Hargrave had been hospitalized numerous times for the treatment of paranoid schizophrenia and had been court ordered to take medication while at the Vermont State Hospital in 1997. In 1999, she executed a DPOA specifying that, in the event of becoming incompetent, she would refuse all psychotropic medications and electroconvulsive therapy. She then filed suit in federal court arguing that Vermont's new procedures for involuntary medication violated the federal Americans with Disabilities Act (ADA) and the federal Rehabilitation Act. The district court dismissed the state's claim that Hargrave did not have standing because she was not under imminent threat of involuntary medication. The court also allowed a class of all mentally ill individuals who have a DPOA to join in the suit. The district court then issued summary judgment that Vermont's act facially discriminated against the mentally ill "to the extent to which the provisions allow their lawfully executed DPOAs to be abrogated."

On appeal, Vermont argued that the ADA's exception for employees who pose "a direct threat" in the workplace would apply to Hargrave and the other plaintiffs, because they would be civilly committed at the time of any hearing for involuntary medication. The court of appeals rejected this, noting that the state would be required to perform an individualized determination of danger at the time the DPOA would be abrogated, and that in any case the ADA exception might not apply outside the context of employment. The court also rejected the state's argument that the act did not discriminate against the mentally ill because it would affect only "the small class of people who are mentally ill, dangerous, committed to State custody, and incompetent to make treatment decisions." The court observed that only mentally ill patients who had been civilly committed and found incompetent would have their treatment preferences overridden, in contrast to "equally incompetent patients who are physically ill or injured" and in contrast to patients committed to a hospital for other reasons, such as tuberculosis or drug addiction.

The court of appeals affirmed the district court's decision finding the act discriminatory and enjoining its implementation.

Sell v. U.S., 539 U.S. 166, 123 S. Ct. 2174 (2003)

In *Sell v. U.S.,* the Supreme Court ruled that in certain rare circumstances, psychotropic drugs may be involuntarily administered solely to render a defendant competent to stand trial, but that alternative legal justifications for involuntary treatment should be pursued first.

Charles Sell was a dentist who had been hospitalized and treated with antipsychotic medication for persecutory delusions involving the police and communists. In 1997, he told officers that God had told him that for "every [FBI] person I kill, a soul will be saved." Shortly thereafter, he was charged with several counts of insurance fraud, found competent to proceed by a federal judge, and released on bail. Bail was later revoked at a hearing in which Sell was "totally out of control" and spat in the judge's face. He then incurred new charges of attempting to murder the FBI agent who had arrested him and a former employee who planned to testify against him, and these were joined for trial with the fraud charges.

Following a new psychiatric evaluation, Sell was found incompetent to stand trial and hospitalized at the U.S. Medical Center for Federal Prisoners, where he refused recommended antipsychotic medication. The hospital conducted administrative hearings by a reviewing psychiatrist and a Bureau of Prisons official, both of whom concluded that Sell was delusional, dangerous, and likely to benefit from medication. Sell contested the hospital's decision at a hearing before the federal judge, who ruled that "anti-psychotic medications are the only way to render the defendant not dangerous and competent to stand trial."

Sell appealed to the federal district court, which affirmed the order for involuntary medication even though it found the judge's determination of dangerousness "clearly erroneous." The court opined that antipsychotic medications were "medically appropriate" and "represent the only viable hope of rendering defendant competent to stand trial." Sell and the government both appealed to the federal court of

appeals, which affirmed both of the district court's findings. The U.S. Supreme Court granted *certiorari*.

The court referred to *Harper v. Collins* and *Riggins v. Nevada* (see both above), which had established that an inmate's liberty interest in avoiding unwanted medication could be overridden "only if the treatment is medically appropriate, is substantially unlikely to have side effects that may undermine the fairness of the trial, and, taking account of less intrusive alternatives, is necessary significantly to further important governmental trial-related interests." The court emphasized that an argument about the government's interest in restoring competence could be avoided if involuntary treatment were pursued instead with the less controversial aim of restoring the defendant's health or reducing dangerousness. The court also noted that prolonged confinement of a defendant resulting from his or her medication refusal might suffice to allay some of the government's concern.

The Supreme Court vacated the lower court's order, finding it had failed to consider whether involuntary medication was essential, in the absence of dangerousness, to further a governmental interest and whether it could impair Sell's ability to put forth a defense.

INFORMED CONSENT

Canterbury v. Spence, 464 F.2d 772 (1972)

In *Canterbury v. Spence*, the District of Columbia Court of Appeals established the doctrine of informed consent as the proper basis for a suit of malpractice involving a failure to warn a patient of all of the potential risks of a procedure that a reasonable patient would wish to know.

In 1958, Dr. Spence evaluated Jerry Canterbury for severe upper back pain. A myelogram revealed a filling defect, and Spence told the 19-year-old that he would require surgery for a ruptured disc. Canterbury did not object or inquire further. Spence spoke to Canterbury's mother over the phone and told her that the procedure was no more dangerous than "any other operation." Canterbury was recovering normally on the day after the operation when he suddenly fell at the side of his bed. He became paralyzed from the waist down. His condition improved little after a second, emergency operation. At the time of trial in 1968, Canterbury was incontinent and required crutches to walk.

Canterbury filed suit in the District of Columbia, alleging that Spence was negligent in his performance and in his failure to inform Canterbury of the risks of surgery. The district court gave a directed verdict against Canterbury, stating that there was no medical testimony to show causality for the paralysis. Canterbury appealed, and the court of appeals reversed and remanded for a jury trial.

The court noted that suits against physicians for failing to disclose risk were not new. The doctrine of informed consent rests on the common law notion, expressed in *Schloendorff v. Society of New York Hospital* (1914), that "every human being of adult years and sound mind has a right to determine what shall be done with his own body." When making decisions about treatment, the patient is in a fiduciary relationship with the physician, relying on information possessed only by the physician. The physician is therefore under a duty to communicate specific information about abnormal findings, diagnosis, recommended treatments and alternatives, and any risks that may be involved in treatment. Having received this information, it is "the prerogative of the patient, not the physician, to determine for himself the direction in which his interests seem to lie." Treatment that has not been approved by the patient constitutes battery by the physician.

The court observed that some jurisdictions evaluate the duty to disclose as a matter of physicians' customary practice. The court concluded that the trier of fact should use a standard of what is "reasonable under the circumstances" when determining what the patient needs to know to make a decision. Because full disclosure is obviously unreasonable, "the scope of the physician's communications to the patient… must be measured by the patient's need, and that need is the information material to the decision… all risks potentially affecting the decision must be unmasked." Even risks of a very low probability should be disclosed if they involve death or serious disability.

The court identified two exceptions to the duty to disclose. In an emergency, a physician may treat an unconscious patient (or one otherwise incapable of consenting) if the "harm from a failure to treat is imminent and outweighs any harm threatened by the proposed treatment." The physician still should attempt to obtain the consent of a family member. The second exception is when the disclosure of risk is medically contraindicated because the disclosure itself may do psychological harm or complicate treatment. This exception may not serve as an excuse for paternalistic behavior on the part of a physician who worries that the patient will decide against the procedure.

Finally, the court noted that a failure to disclose does not prove malpractice. A causal connection must exist, in that the disclosure would have resulted in a decision by the patient to decline the treatment. In determining this issue, some courts had used a subjective standard, inquiring of the patient whether he or she would have agreed to the treatment if informed of the risk. The court of appeals reasoned that this "places the physician in jeopardy of the patient's hindsight and bitterness." Instead, the court should use an objective standard to determine what "a prudent person in the patient's position would have decided if suitably informed of all perils bearing significance."

Kaimowitz v. Michigan Department of Mental Health, No. 73-19434-AW Mich. Cir. Ct., Wayne Co. (1973)

In *Kaimowitz v. Michigan Department of Mental Health*, a Michigan court acted on the petition of a third party in halting experimental psychosurgery on an involuntarily committed patient.

In 1955, John Doe was civilly committed to the Ionia State Hospital as a Criminal Sexual Psychopath under Michigan's Criminal Sexual Psychopathic Law. He had murdered and raped a student nurse while he was a patient at Kalamazoo State Hospital. In 1972, Doe signed an informed consent form to receive psychosurgery as part of a study of the treatment of uncontrollable aggression. The study was funded by the state of Michigan and had been approved by two separate review committees. Doe was found to be the only appropriate candidate for the surgical experiment and was scheduled to have depth electrodes inserted into his brain. A third party, Kaimowitz, became aware of the planned experimental psychosurgery and notified the press. Kaimowitz then filed a writ of *habeas corpus* on behalf of Doe, alleging that he was being illegally detained for the purpose of experimental psychosurgery. As a result of the publicity, the Department of Mental Health put a stop to the experiment.

The Michigan court first considered the constitutionality of Doe's detention and directed his release. The court determined that the issue of consent was not moot, since similar experiments could arise in the future. The court held that psychosurgery should never be undertaken upon involuntarily committed patients when there is a high-risk, low-benefits ratio because of the impossibility of obtaining truly informed consent. The court based this conclusion on the common law doctrine of informed consent and the Constitution.

The court noted that psychosurgery was a dangerous and irreversible procedure with no predictable benefits to the patient or to scientific knowledge. Therefore, the adequacy of the patient's consent must be closely scrutinized. Under the common law, a person has the right to the inviolability of the body, and a medical operation performed without the patient's informed consent is battery. Informed consent must be competent, knowing, and voluntary. The court referred to the Nuremberg Code of 1948 regarding the subject of medical experimentation: "The person involved… should be so situated as to be able to exercise free power of choice, without the intervention of any element of force, fraud, deceit, duress, overreaching, or other ulterior form of constraint or coercion…. The degree of risk to be taken should never exceed that determined by the humanitarian importance of the problem to be solved by the experiment."

After hearing testimony regarding life in a state hospital, the court concluded that "involuntarily confined mental patients live in an inherently coercive institutional environment" in which it is impossible to give truly informed consent. The patient is stripped of supports and self-worth and feels compelled to cooperate with the institutional authorities who control his or her freedom.

The court raised other constitutional concerns. By damaging a patient's creativity, psychosurgery may impinge on the First Amendment right to generate ideas. "Intrusion into one's intellect" may also violate the right to privacy found in the First, Fifth, and Fourteenth Amendments. The court also speculated that psychosurgery might implicate the Eighth Amendment right to be free from cruel and unusual punishment.

THE RIGHT TO DIE

Cruzan v. Director, 110 S.Ct. 2841 (1990)

In *Cruzan v. Director*, the U.S. Supreme Court for the first time considered the question whether a state may limit a patient's right to refuse life-sustaining treatment, in this case by requiring "clear and convincing" evidence of the incompetent patient's wishes.

Nancy Cruzan entered into a "persistent vegetative state" after a car crash in 1983. She required gastric tube feeding and hydration to stay alive. After several years, when it became clear that she had no chance of regaining her mental faculties, her parents asked that the artificial nutrition be terminated. The hospital refused to honor the request without court approval. The Missouri trial court found that Cruzan had a fundamental right, under the state and federal constitutions, to refuse "death prolonging procedures." The court relied upon statements Cruzan had made to a friend years earlier and determined that she would not wish to continue the life-sustaining procedures if she were currently competent to make the decision. Though agreeing with the finding, Cruzan's guardian *ad litem* believed he was obligated to appeal the decision.

The Missouri Supreme Court reversed the decision, refusing to find a broad constitutional "right of a person to refuse medical treatment in every circumstance." Missouri's Living Will Statute indicated a state policy strongly in favor of the preservation of life. The court rejected the idea that Cruzan's parents could choose for her in the absence of a formal living will or "clear and convincing, inherently reliable evidence" of her wishes. Cruzan's statements to her roommate did not meet this standard. The U.S. Supreme Court granted *certiorari* to consider whether Cruzan had a right under the Constitution that would require the hospital to withdraw life-sustaining treatment.

The court noted that advances in medical technology had led to an increase in the number of cases involving the right to refuse life-sustaining treatment. In the New Jersey case of *In re Quinlan* (1976), a father was given judicial approval to disconnect the respirator that was maintaining the life of his daughter, who was in a persistent vegetative state. The New Jersey Supreme Court based its decision on the constitutional right of privacy. The state's interest in prolonging life had to give way to the individual's right to privacy, particularly in light of the poor prognosis. The father was allowed to make the decision for his incompetent daughter. Most courts since *Quinlan* had based the right to refuse treatment on the common law right to informed consent.

The U.S. Supreme Court surveyed several other informed consent cases around the country and noted a variety of standards as well as methods for determining how an incompetent patient exercises the right to refuse medical treatment. The majority opinion confined itself to the

narrow issue whether the Constitution prohibited Missouri from choosing its own method of dealing with the "right to die." The court held that the state's procedural requirement that evidence of the incompetent's wishes as to the withdrawal of treatment be proved by clear and convincing evidence did not violate the Constitution. A state may choose to accept the "substituted judgment" of close family members but is not required to do so.

The state has the right to assert an unqualified interest in the preservation of human life without consideration for the quality of any individual's life. The state also has an interest in safeguarding the individual's personal decisions regarding matters of life and death. Not all incompetent patients have family to make decisions for them, and not all family members act in a patient's best interest. The risk of error in continuing life-sustaining treatment is simply to maintain the *status quo*, whereas treatment withdrawal is irreversible.

In a concurrence, Justice O'Connor noted that "no national consensus has yet emerged on the best solution for this difficult and sensitive problem," which should be "entrusted to the 'laboratory' of the States." In a separate concurrence, Justice Scalia argued that the removal of life-sustaining treatment should be equated with assisted suicide, which most states forbid.

Four justices dissented in lengthy opinions arguing that "Nancy Cruzan is entitled to choose to die with dignity." They argued that there exists a fundamental constitutional right to refuse medical treatment. The fact that Cruzan was incompetent does not deprive her of this right, which can be exercised meaningfully only by others acting in her best interest. Since no third party's situation would be improved, and no harm to others would be averted, no state interest could outweigh the individual's right in this case. Justice Stevens argued that the majority's decision "permits the State's abstract, undifferentiated interest in the preservation of life to overwhelm the best interests of Nancy Beth Cruzan." He maintained that life, death, and faith are private matters, and Missouri's policy was designed to "define life, rather than to protect it."

Washington v. Glucksberg, 117 S.Ct. 2258 (1997)

In the case of *Washington v. Glucksberg*, the U.S. Supreme Court considered whether a state's ban on physician-assisted suicide violates the Due Process or Equal Protection clauses of the Fourteenth Amendment.

In 1994, four physicians and three severely ill plaintiffs, joined by the nonprofit organization Compassion in Dying, brought suit in district court arguing that the Washington statute criminalizing assisted suicide was unconstitutional. They argued that there exists "a liberty interest protected by the Fourteenth Amendment which extends to a personal choice by a mentally competent, terminally ill adult to commit physician assisted suicide." The district court agreed. The court also found that the statute violated the Equal Protection Clause by treating the terminally ill who choose physician-assisted suicide differently from terminally ill patients who choose to refuse life-sustaining measures.

The court of appeals affirmed the lower court holding, though without agreeing that the statute violated the Equal Protection Clause. The court concluded that "the Constitution encompasses a due process liberty interest in controlling the time and manner of one's death—that there is, in short, a constitutionally recognized 'right to die'." The U.S. Supreme Court granted *certiorari*.

The court observed that almost every democracy criminalizes assisted suicide. In America, suicide was a crime until legislatures decided that it was unfair to punish a suicide's family. In recent years, and in many states, prohibitions against assisted suicide had been reaffirmed. In 1991, voters in Washington State rejected a ballot initiative that would have permitted a form of physician-assisted suicide. In contrast, in 1994, voters in Oregon enacted a Death with Dignity Act that legalized physician-assisted suicide for competent, terminally ill adults. In 1997, the president signed federal legislation prohibiting the use of federal funds for physician-assisted suicide.

The court considered whether the Due Process Clause protects a right to commit suicide, which itself includes a right to receive assistance in committing suicide. Several fundamental rights have been recognized as protected by the Due Process Clause of the Fourteenth Amendment, including the right to marry, to have children, to direct the education of children, to privacy in marriage, to contraception, to abortion, and to refuse life-sustaining medical treatment (see *Cruzan v. Director* above). The court expressed reluctance to impose its own policy preferences by asserting new and open-ended liberties not "deeply rooted in this Nation's history and tradition." The court distinguished the right to assisted suicide from the right established in *Cruzan*, which was based on the common law rule that unwanted treatment is battery.

Even though the right to assisted suicide is not a fundamental liberty interest protected by the Fourteenth Amendment, the Washington statute must still relate to a legitimate government interest. The court observed that the state has an "unqualified interest in the preservation of human life," as noted in *Cruzan*. The state has an interest in preventing suicide, in treating and protecting depressed patients, and in protecting the integrity and ethics of the medical profession. The state also has an interest in protecting the poor, the elderly, and the disabled from abuse, neglect, and mistakes, including "the real risk of subtle coercion and undue influence in end of life situations."

Legalizing assisted suicide for competent, terminally ill adults could start the state down a slippery slope leading to the practice of euthanasia. Recent studies had indicated that in the Netherlands, where assisted suicide had been legalized, thousands of patients were administered lethal doses of morphine without their consent.

Several justices wrote concurring opinions. Justice Stevens noted that palliative care cannot alleviate all pain and suffering; situations will arise in which "an interest in

hastening death is legitimate… [and] entitled to constitutional protection." The justices observed that the process of data gathering and experimentation is better suited to legislative bodies, who would strike the proper balance between state and individual interests.

CONFIDENTIALITY

In re Lifschutz, 487 P.2d 557 (1970)

In 1970, the Supreme Court of California ruled that psychotherapist–patient privilege was not absolute and belonged to the patient, not the therapist.

After being assaulted, Joseph Housek filed a civil suit for damages in a California court. He alleged that the assault caused him "physical injuries, pain, suffering, and severe mental and emotional distress." During deposition, Housek acknowledged that he had received psychiatric treatment from Dr. Joseph Lifschutz approximately 10 years earlier. The respondent subpoenaed Lifschutz and medical records relating to his treatment of Housek. At his deposition, Lifschutz refused to produce any medical records and refused to answer any questions relating to the treatment. Housek was not present and neither expressly claimed nor waived a psychotherapist–patient privilege.

A California superior court ordered Lifschutz to comply with the subpoena, reasoning that, in instituting litigation, Housek had tendered as an issue his mental and emotional condition. Therefore, California's statutory psychotherapist–patient privilege did not apply. Lifschutz continued to refuse. The court of appeals and U.S. Supreme Court declined to hear the case. The superior court found Lifschutz in contempt and had him confined. Lifschutz sought a writ of *habeas corpus*, which was denied by the court of appeals. The California Supreme Court agreed to consider the writ, noting the belief by many psychiatrists in an absolute privilege of confidentiality.

The court observed that psychotherapy is a profession "essential to the preservation of societal health and well-being." Legislatures in California and other states have recognized that psychotherapy must be conducted in an environment of confidentiality. However, the need for confidentiality must be balanced with society's need for determining truth in litigation. The court concluded that the patient, not the psychotherapist, has a constitutional claim to a "right of privacy." Housek, the holder of the privilege, waived his right to keep such information confidential when he disclosed in deposition that he had received treatment from Lifschutz.

The court dispensed with Lifschutz' argument that any compromise of confidentiality would have an adverse effect on the general practice of psychotherapy. Psychotherapy had flourished even though no state provided for absolute confidentiality. Lifschutz also argued that the existence of an absolute clergy–penitent privilege denied equal protection to psychotherapists in that the confidentiality of the clergy–penitent relationship was being unfair deference relative to that accorded a psychotherapist and his patient. The court observed that the relationship of clergy to a penitent serves a different purpose than the psychotherapeutic relationship; the California legislature did not act irrationally in granting the absolute privilege to clergy only.

In conclusion, the court recommended that trial courts carefully control compelled disclosures of psychiatric information, because of the potential invasion of a patient's constitutional privacy interests. Courts may take various steps to protect litigants from embarrassment, publicity, and prejudicial evidence.

Doe v. Roe, N.Y. Supp. 2d 668 (1977)

In *Doe v. Roe*, a New York court agreed that statute, professional regulations, professional ethics, and common law all support a right to confidentiality for patients.

In 1977, Dr. Jane Roe, a psychiatrist, and her husband, Peter Poe, a psychologist, published a book that described psychotherapeutic sessions conducted 8 years earlier with Jane Doe and her former husband. The book included extensive verbatim descriptions of the patients' thoughts, feelings, emotions, and sexual fantasies. It also described the disintegration of the marriage. Doe sued for damages for breach of privacy and for an injunction against publication.

Doe asserted several theories in support of a patient's right to confidentiality. New York State statute and licensing regulations both prohibit disclosure of information obtained from a patient by a physician. The physician-patient relationship is contractual and implies a promise by the physician to obey the Hippocratic Oath; the Oath includes a provision to keep secret all communications from the patient. Finally, courts have increasingly recognized "privacy actions" for unreasonably publicizing what should have been left in confidence.

The court reviewed the statutory and case law, public policy, the Hippocratic Oath, and the Principles of Medical Ethics of the American Medical Association. The court concluded that "a physician, who enters into an agreement with the patient to provide medical attention, impliedly covenants to keep in confidence all disclosures made by the patient concerning the patient's physical or mental condition as well as all matters discovered by the physician in the course of examination or treatment." The court found this to be particularly true in a psychiatric relationship, where a patient is expected to discuss "personal material of the most intimate and disturbing nature."

The defendants argued that Doe and her ex-husband had consented to the publication. The court rejected outright "the value of an oral waiver of confidentiality given by a patient to a psychiatrist during the course of treatment." The court also rejected the defendants' contentions that the book's contribution to scientific knowledge outweighed Doe's right to confidentiality. The court also rejected the claim that the identity of Doe and her ex-husband had been adequately disguised.

The court awarded damages of $20,000 and permanently enjoined the defendants from circulating or publishing the book. The court refused to award punitive damages, noting

that "the defendants' acts were not willful, malicious, or wanton—they were merely stupid."

Jaffee v. Redmond, 116 S.Ct. 1923 (1996)

In 1996, the U.S. Supreme Court established a therapist–patient privilege under federal law that extends to therapy provided by licensed social workers, as well as to psychiatrists and psychologists.

Mary Lu Redmond had shot and killed Ricky Allen while working as a police officer at the Village of Hoffman Estates, Illinois, in 1991. Following the traumatic incident, Redmond received extensive counseling from a clinical social worker, Karen Beyer. Allen's family brought suit against Redmond and her employer, alleging that Redmond had violated Allen's constitutional rights by using excessive force. Allen's family sought access to the social worker's therapy notes for use in cross-examination. Redmond argued that the records were protected against disclosure by her psychotherapist–patient privilege.

The district court judge disagreed and ordered the disclosure. At deposition, and on the witness stand, both Redmond and Beyer refused to follow the judge's order. The judge advised the jury that the refusal was unjustified and that the jury could presume that the contents of the notes would have been unfavorable. The jury ruled in favor of the petitioner and awarded damages. The federal court of appeals reversed and remanded, recognizing a psychotherapist privilege under Rule 501 of the Federal Rules of Evidence. The U.S. Supreme Court granted *certiorari,* because the federal courts had not reached uniform opinions on the issue.

Rule 501 of the Federal Rules of Evidence allows federal courts to define new privileges by interpreting "common law principles… in the light of reason and experience." The court recognized the important role of psychotherapy: "The psychotherapist privilege serves the public interest by facilitating the provision of appropriate treatment for individuals suffering the effects of mental or emotional problems. The mental health of our citizenry, no less than its physical health, is a public good of transcendent importance." The court also recognized that effective psychotherapy depends on an atmosphere of confidence and trust. All states have enacted some form of psychotherapist privilege, and a state's promise of confidentiality would have little value if not honored by a federal court.

The court concluded that "confidential communications between a licensed psychotherapist and her patients in the course of diagnosis or treatment are protected from compelled disclosure under Rule 501 of the Federal Rules of Evidence." The privilege should extend to communications made to licensed social workers; social workers serve members of the public who cannot afford the assistance of a psychiatrist or psychologist, but whose interests in psychotherapy are no different. In a dissenting opinion, Justice Scalia argued that the extension of the privilege to licensed social workers ignored the difference in training and credentials.

MALPRACTICE LIABILITY

Roy v. Hartogs, 381 N.Y.S. 2d 587 (1976)

In 1976, a New York court of appeals held that sexual intercourse between a therapist and his patient constituted medical malpractice.

Julie Roy received psychotherapy from Dr. Renatus Hartogs from 1969 to 1970. Roy alleged that Hartogs induced her to have sexual intercourse with him as part of her therapy. She sued Hartogs, arguing that his improper treatment emotionally and mentally injured her to such an extent that she was required to seek hospitalization on two occasions in 1971. At trial, the jury awarded Roy $50,000 in compensatory damages and additional punitive damages. Hartogs appealed.

The New York Court of Appeals noted that, as a matter of public policy, seduction had been abolished as a cause of action. In this case, the court held that sexual intercourse constituted medical malpractice, a different cause of action. In a concurring opinion, the presiding justice observed that "all imminent experts in the psychiatric field including the American Psychiatric Association abjure sexual contact between patient and therapist as harmful to the patient and deviant from accepted standards of treatment of the mentally disturbed."

The court reversed, however, on the issue of damages. The court concluded that, in light of the plaintiff's pre-existing mental condition, an award of more than $25,000 would be excessive. The court also found no evidence that Hartogs' conduct was so wanton or reckless as to permit an award for punitive damages.

In a dissenting opinion, one justice observed that Roy was presumably competent to consent to a sexual relationship in the course of therapy and did not complain about the sexual relationship at the time. If Hartogs committed an ethical violation, as opposed to malpractice, he should suffer the sanctions of the appropriate medical authority rather than face civil damages for malpractice.

Clites v. Iowa, 322 N.W. 2d 917 (Iowa Ct. App. 1982)

In *Clites v. Iowa*, a state court considered a case in which tardive dyskinesia was an adverse outcome of antipsychotic treatment that constituted medical malpractice.

Timothy Clites was a mentally retarded young man who resided at the Glenwood State Hospital-School, a residential facility operated by the state of Iowa. In 1970, at the age of 18, Clites was prescribed major tranquilizers for aggression. After 5 years of treatment with multiple antipsychotics, Clites was diagnosed with tardive dyskinesia. In 1976, his father submitted a claim to the Iowa State Appeal Board for the negligent use of antipsychotic medication and physical restraints. The board failed to take action, and his father filed a claim in state court for negligence.

The trial court reached several findings of fact. There was no evidence in the record of severe aggression requiring

major tranquilizers as treatment. No physician examined Clites over a 3-year period, even though patients who are prescribed major tranquilizers should be closely monitored. "Drug holidays" were not attempted to monitor Clites' progress and need for continued medication. Tardive dyskinesia should have been recognized and responded to with a change in medication or consultation. "Polypharmacy" was not the least intrusive means of treatment. Major tranquilizers were used for the convenience of staff rather than treatment; the use of physical restraints was "cruel and inhuman" and conducted for staff convenience.

Clites' expert testified that standard practice was to obtain a written informed consent from a patient or guardian before administering major tranquilizers. Clites' parents were never informed of the potential side effects and, therefore, could not have given informed consent. The court observed that Clites' condition worsened following the use of antipsychotics, in that he became increasingly aggressive and self-abusive. At the time of the suit, he was described as "only a fraction of his former self."

The court awarded damages of over $700,000 for past and future medical expenses and pain and suffering. The state appealed.

The court of appeals noted that the standard of care owed to patients by hospitals and physicians was not in dispute: "Doctors are held to such reasonable care and skill as is exercised by the ordinary physician of good standing under like circumstances." The court found substantial support in the record for the trial court's conclusion that Clites' condition was caused by tardive dyskinesia induced by the negligent administration of major tranquilizers, that the condition was permanent, and that the damages awarded were appropriate.

DUTY TO PROTECT

Tarasoff v. Regents of the University of California, 551 P.2d 334 (1976)

In 1976, the California Supreme Court ruled that therapists have a "duty to protect" third parties from foreseeable danger posed by a patient. Other jurisdictions have followed suit, either with case law or legislation imposing *Tarasoff*-like duties on therapists.

In 1969, Prosenjit Poddar, a student at the University of California at Berkeley, killed Tatiana Tarasoff. Two months earlier, he had informed his psychologist, Dr. Moore, that he intended to kill Tarasoff when she returned from summer vacation. Moore notified the campus police and requested that they confine Poddar for psychiatric evaluation. The campus police took Poddar into custody but found him to be rational, accepted his denial that he would harm Tarasoff, and released him. Moore's supervisor at the university health service directed that no further attempts be made to confine Poddar and that all notes from his therapy be destroyed. No one notified Tarasoff or her family that she was in danger.

Tarasoff's parents filed suit against Moore, his supervisor, the campus police, and the regents of the University of California. The superior court concluded that there was no cause for action against the defendants. The plaintiffs appealed to the California Supreme Court.

In 1974, the court issued a ruling establishing a therapist's "duty to warn" the potential victim of predictable danger. In 1976, following an outpouring of protest and the submission of an amicus brief by the American Psychiatric Association, the court took the unusual step of reconsidering the matter, at which time they established the broader "duty to protect." According to the court, "When a therapist determines, or pursuant to the standards of his profession should determine, that his patient presents a serious danger of violence to another, he incurs an obligation to use reasonable care to protect the intended victim against such danger."

The court noted that persons generally owe a duty of care to anyone foreseeably endangered by their conduct, if their conduct is unreasonably dangerous. The common law has traditionally excused persons from responsibility for harm caused by another person, unless they bear a "special relationship" to the dangerous person or to the third party at risk. The court found a "special relationship" to exist between therapists and patients. In analogous cases, physicians had been held liable for failing to diagnose or warn family members of a patient's infectious disease.

The court rejected the argument presented in the amicus brief that therapists are unable to predict violent acts. Therapists are not required to predict violence precisely; they must only exercise "that reasonable degree of skill, knowledge, and care ordinarily possessed and exercised by members of [the profession] under similar circumstances." The court also dispensed with the argument that therapy would be harmed by both the potential and actual violations of confidentiality. The court noted that the public interest in safety outweighs the right to privacy. The professional ethics of the American Medical Association and statutes defining patient confidentiality make exception for cases in which a patient is thought to pose a danger to others. The court concluded, "The protective privilege ends where the public peril begins."

The court found no cause of action against the police for failing to confine Poddar, because public employee laws provide immunity for such exercises of discretion. The court remanded the case to the lower court to determine whether the defendants were liable for failing to take other measures to protect the victim. The court explained that a therapist might be required "to warn the intended victim or others likely to apprise the victim of the danger, to notify the police, or to take whatever other steps are reasonably necessary under the circumstances."

Lipari v. Sears Roebuck, 497 F. Supp. 1985 (1980)

In *Lipari v. Sears*, the Nebraska District Court extended the duty to protect to third parties belonging to a class of foreseeable victims, rather than to a specifically identified individual.

In 1977, Ulysses Cribbs entered a nightclub in Omaha, Nebraska, and fired a shotgun into a crowded dining room. He killed Dennis Lipari and wounded his wife, Ruth. She filed a wrongful death suit against Sears Roebuck & Co. for negligence in selling a gun to Cribbs when they "knew or should have known [he] had been adjudged mentally defective or had been committed to a mental institution." Sears then filed a third-party complaint against the United States under the Federal Torts Claims Act. Cribbs had been a patient at the Veterans Administration at the time he purchased the gun, though he dropped out of day-care treatment against the advice of his doctors. Sears claimed that the Veterans Administration knew or should have known that Cribbs was dangerous to himself or others yet failed to take customary steps to treat him. The United States filed a motion to dismiss the action.

The district court denied the United States' motion to dismiss the claim. Noting that the Nebraska Supreme Court had never addressed the issue of the therapist's duty to third persons, the district court considered the decision in the related California case of *Tarasoff v. Regents* (see above). The court found that the relationship of a therapist to a patient gives rise to a duty to third persons in Nebraska as well. The court did not accept the argument of the United States that a therapist cannot accurately predict which patients will pose a danger to others. It found instead that the "standard of care for health professionals adequately takes into account the difficult nature of the problems facing psychotherapists" and that a therapist would not be held liable simply for making a mistake.

The United States also argued that a therapist's duty to third persons should be limited to warning identifiable potential victims. Referring again to *Tarasoff*, the court determined that "whatever other steps are reasonably necessary under the circumstances" might require more than warning. Foreseeability is more important than identifiability, and "the V.A.'s employees could have reasonably foreseen an unreasonable risk of harm to the Liparis or a class of persons of which the Liparis were members."

EXPERT WITNESS TESTIMONY

Frye v. U.S., 293 F. 1013 (D.C. Cir. 1923)

In 1923, the District of Columbia Court of Appeals established what would come to be known as the "*Frye* test" for admissibility of scientific evidence based on general acceptance of the methodology by the scientific community.

James Frye was convicted of murder. At trial, he offered an expert witness to testify on the results of a "deception test." The premise of the test (an early form of "lie detector") was that systolic blood pressure rises when a subject tells a lie. The trial judge excluded the testimony. Frye appealed. His attorneys argued that the grounds for exclusion of expert testimony was a novel question. They proposed that "when the question involved does not lie within the range of common experience or common knowledge, but requires special experience or special knowledge, then the opinions of witnesses skilled in that particular science, art, or trade to which the question relates are admissible in evidence."

The court of appeals noted that it is difficult to define the point at which a scientific principle or discovery becomes demonstrable rather than experimental. The court concluded that "while courts will go a long way in admitting expert testimony deduced from a well-recognized scientific principle or discovery, the thing from which the deduction is made must be sufficiently established to have gained general acceptance in the particular field in which it belongs." The court upheld the decision, noting that the systolic blood pressure deception test had not gained sufficient standing and scientific recognition to justify its admission as expert testimony.

Daubert v. Merrell Dow, 61 U.S.L.S. 4805, 113 S.Ct. 2786 (1993)

In *Daubert v. Merrell Dow*, the U.S. Supreme Court held that the *Frye* test had been superseded by the Federal Rules of Evidence, with the result that federal courts have a broader range of factors to consider when determining whether scientific evidence is relevant and reliable.

Jason Daubert and Eric Schuller were born with serious birth defects. Their parents sued Merrell Dow Pharmaceuticals, Inc., in California court, alleging that the birth defects resulted from the mothers' use of Bendectin, a prescription anti-nausea drug. The case was moved to federal court. After extensive discovery, Merrell Dow moved for summary judgment. Merrell Dow's expert submitted an affidavit stating that more than 30 published studies had concluded that there was no evidence that Bendectin causes birth defects. The petitioners offered the testimony of eight other experts who concluded the opposite based on pharmacological, *in vitro,* and animal studies and a re-analysis of previously published epidemiological studies.

The district court concluded that the petitioner's evidence was not "sufficiently established to have general acceptance in the field to which it belongs" and therefore not admissible under the *Frye* test. The re-analysis of data had not been published or subjected to peer review. The court granted summary judgment in favor of Merrell Dow. The court of appeals affirmed, citing the prior decision in *Frye v. U.S.* (see above). The U.S. Supreme Court granted *certiorari* in light of differing opinions among federal courts regarding the proper standard for the admission of expert testimony.

The court observed that the *Frye* test of "general acceptance" had been the dominant standard in determining the admissibility of scientific evidence at trial. The plaintiffs argued that the *Frye* test had been superseded by the adoption of the Federal Rules of Evidence. The court agreed. Rule 402 of the Federal Rules of Evidence establishes that "evidence which is not relevant is not admissible." Rule 702 provides that "if scientific, technical, or other specialized knowledge will assist the trier of fact to understand the evidence or to determine a fact in issue, a witness qualified

as an expert by knowledge, skill, experience, training, or education, may testify thereto in the form of an opinion or otherwise."

The *Frye* test is not mentioned in the Rules, and "a rigid 'general acceptance' requirement would be at odds with the 'liberal thrust' of the Federal Rules and their 'general approach of relaxing the traditional barriers to opinion testimony'." The court observed that scientific knowledge is a process, rather than a certainty. To qualify as scientific knowledge, expert conclusions must be "derived by the scientific method." Under the Rules, the trial judge must ensure that all scientific evidence is not only relevant, but reliable.

The court proposed several factors, but not a "definitive checklist or test" that bears on the inquiry into whether the testimony is scientific and relevant. Trial judges may consider whether the theory or technique can be (and has been) tested, whether it has been subjected to peer review and publication, what its error rate is, what standards control its operation, and whether it has been generally accepted within the relevant scientific community. The court emphasized that the inquiry is flexible and that the focus must be solely on principles and methodology, not on the ultimate conclusion.

The court remarked on other rules that may apply. Rule 703 provides that otherwise inadmissible hearsay evidence may be admitted if it is "of a type reasonably relied upon by experts in the particular field in forming opinions or inferences upon the subject." Rule 706 allows the court to appoint an expert of its own choosing. Rule 403 permits the exclusion of relevant evidence if the danger of unfair prejudice or confusion outweighs its probative value. Finally, the court emphasized that the conventional devices of cross-examination, presentation of contrary evidence, and instruction on the burden of proof are appropriate safeguards for challenging admissible, but questionable, evidence.

Kumho Tire v. Carmichael, 119 S.Ct. 1167 (1999)

In *Kumho Tire v. Carmichael*, the U.S. Supreme Court extended to technical or other specialized knowledge the holding in *Daubert* (see above) regarding scientific knowledge.

In 1993, the rear tire blew out on a minivan driven by Patrick Carmichael. In the resultant accident, one of his passengers died and others were injured. The Carmichaels sued the tire maker and distributor, claiming that the tire was defective. Their case relied largely on the testimony in deposition of a mechanical engineer and expert in tire failure analysis, who inspected the tire and applied several premises to conclude that a defect in manufacture or design had caused the blow-out.

The district court examined the expert's methods in light of the factors suggested in *Daubert v. Merrell Dow* and excluded the testimony as not reliable. The court of appeals reversed, noting that the Supreme Court in *Daubert* explicitly limited its holding to cover only the "scientific context" rather than "skill- or experience-based observation." The U.S. Supreme Court granted *certiorari* in light of uncertainty among federal courts whether *Daubert* applies to expert testimony based on "technical" or "other specialized" knowledge.

The court conceded that the ruling in *Daubert* referred only to "scientific knowledge," since that was the issue at hand. The rationale for the decision, however, applies equally to other expert testimony. In practice, it would be impossible for judges to apply different rules, because technical and scientific fields use overlapping methodologies.

The court agreed that a trial judge may use the reliability factors discussed in *Daubert*, because engineering testimony "rests upon scientific foundations." The court noted that in other cases, "the relevant reliability concerns may focus upon personal knowledge or experience." The court emphasized that the *Daubert* factors were flexible and not definitive.

The court reviewed the trial judge's conclusion that the expert could not reliably determine the cause of the tire's separation using the methods to which he testified. He had applied rules that other experts in the field do not use, and he had disregarded the results of his own inspection. The court concluded that the district court had not abused its discretion in excluding the evidence.
